# Managing Application Complexity in the SAMRAI Framework

---

---

**Rich Hornung**

***Center for Applied Scientific Computing  
Lawrence Livermore National Laboratory***

[www.llnl.gov/CASC/SAMRAI](http://www.llnl.gov/CASC/SAMRAI)  
[hornung@llnl.gov](mailto:hornung@llnl.gov)

*Workshop on Object-Oriented and Component  
Technology for Scientific Computing  
July 23-25, 2001*

# Structured AMR (SAMR) employs a dynamically adaptive “patch hierarchy”

- Hierarchy defines nested levels of varying mesh resolution (space & time)
- Data is stored on patches covering logically-rectangular regions in index space

# ***SAMRAI: Structured Adaptive Mesh Refinement Application Infrastructure***

---

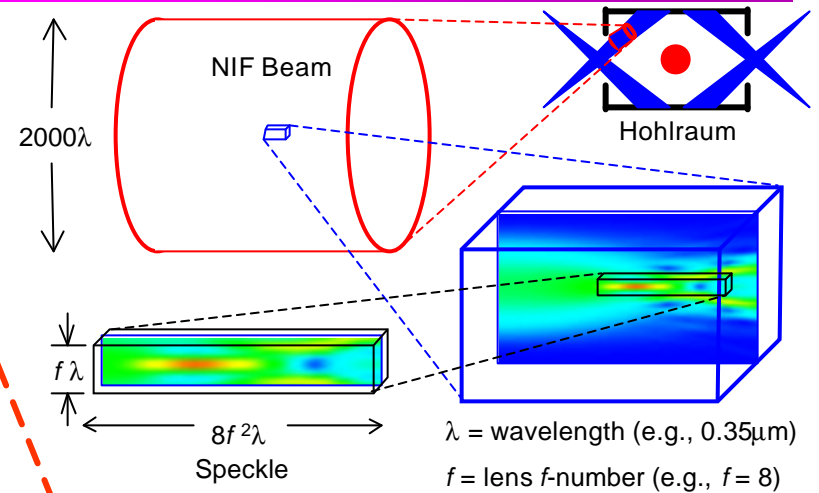

---

- **SAMRAI is an object-oriented (C++) software framework for SAMR multi-physics application development**
- **Design reflects survey of long-term LLNL AMR interests**
- **Research base for application, algorithm, numerical, software, parallel computing issues in SAMR**
- **Application-software feedback loop is main driver**
  - SAMRAI team: expertise in SAMR algorithms, numerics, software
  - app. collaborators: experts in numerical, physical,... problem issues
  - applications push SAMR technology into *new problem domains*
  - new capabilities are folded back into framework

# ALPS is an advanced simulation tool for laser plasma instabilities

Understanding instabilities in laser-plasma interactions is critical in the design of plasma physics experiments

*Numerical simulations need to accommodate multiple diverse scales*

*Locally refined grids resolve wave interaction where high accuracy is needed*

# Hybrid continuum-DSMC AMR methods efficiently resolve interface dynamics

Interface instability problems (e.g., Richtmyer-Meshkov) involve coarse-scale hydrodynamic transport and fine-scale molecular diffusion

*Particles resolve fine-scale dynamics of mixing region in an adaptive calculation*

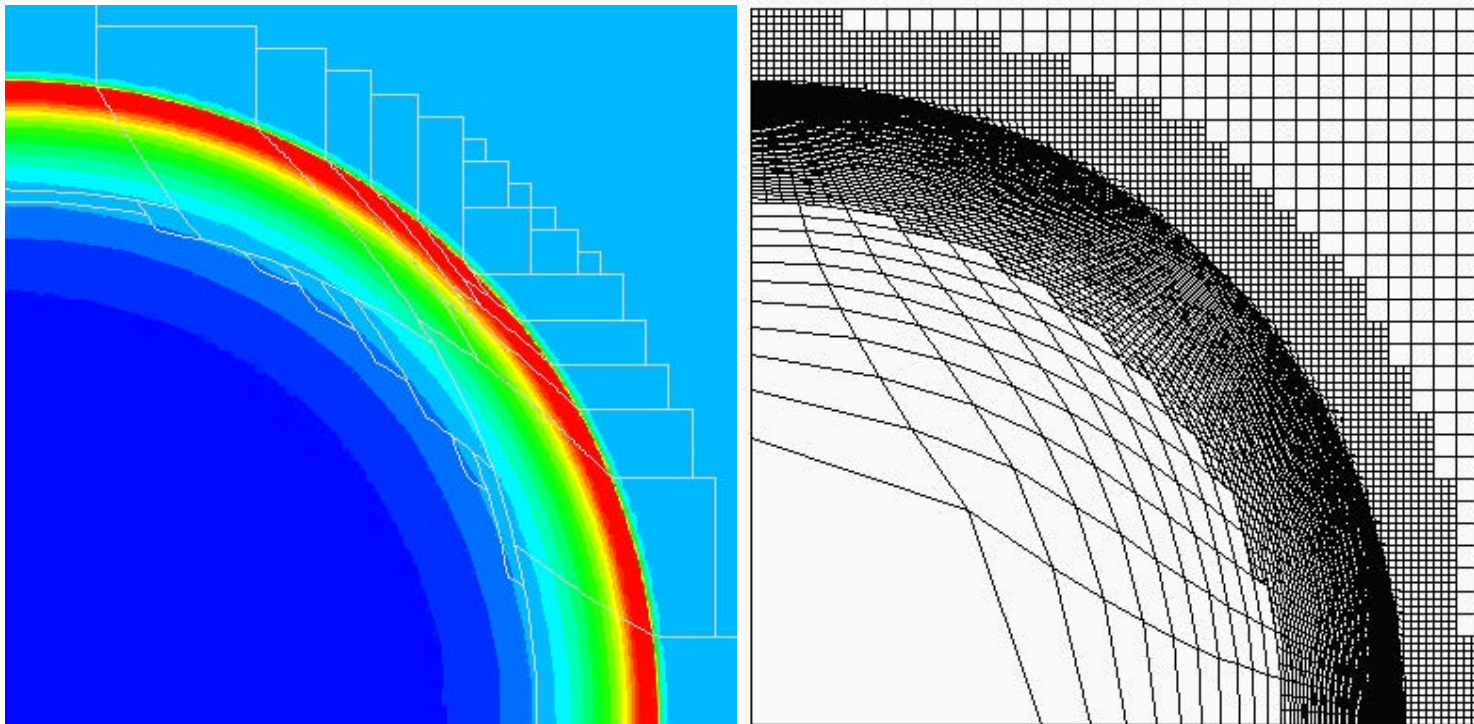

- interface region grows and moves as instability evolves
- standard CFD simulation of turbulent mixing is limited by finest mesh scale
- particle resolve molecular behavior but are too expensive for large domains

# ALE-AMR combines structured grid ALE and AMR for shock hydrodynamics

Accurate ALE simulations (e.g., detonation fronts) require dynamic concentration of mesh points

- staggered mesh formulation is challenging in AMR
- coarse and fine meshes deform at different rates

Sedov blast wave density and Lagrangian mesh

# **SAMRAI is used in diverse adaptive mesh refinement application research efforts**

---

- **Adaptive Laser-Plasma Methods (ALPS) -- Dorr, Garaizar, Hittinger (CASC/LLNL)**
- **Continuum-particle hybrid methods -- Hornung (CASC), Garcia (SJSU)**
- **ALE-AMR -- Pember, Anderson, Elliott (CASC/LLNL)**
- **Fractures in solids -- Garaizar, Hornung, et al. (CASC/LLNL)**
- **Radiation diffusion -- Kapfer, Woodward, P. Brown (CASC)**
- **Ocean current simulation -- Wickett, Hernstein (CASC/LLNL)**
- **Industrial fire simulation -- Smith, Rawat (Univ. Utah), Wissink (CASC)**
- **Global Geospace Circulation Model (GGCM) -- Raeder, Wang (UCLA)**

# SAMRAI simplifies complexity management in SAMR applications

---

---

- Software must support evolving understanding of application and numerical issues (key: proper abstractions)
- **Application folks want to do certain things easily:**
  - quickly focus on numerical routines, solution algorithms
  - manage variables between coupled numerical models
  - manipulate data on dynamically changing, locally-refined mesh (data copying, coarsening, refining, time interpolation, ...)
- **SAMRAI design goals:**
  - robust code base shared by diverse, complex applications (“infrastructure” common across apps. factored into framework)
  - flexible algorithmic framework to explore new solution methods
  - extensible parallel support for general dynamic data configurations  
(extensivity *without recompilation*; e.g. via inheritance)

# User view of SAMRAI is a “toolbox” of classes for application development

~570, 000 lines  
~300 classes

Vizamrai

## Integration Algorithms

Time Refinement Algorithm  
Hyperbolic Conservation Laws  
Method-of-lines Time Integrator  
Implicit Integrator

## Solvers

Package Interfaces  
(PETSc, KINSOL, PVODE)  
Vector Kernel Support  
Poisson Solver (FAC & *hypre*)

## Mesh Management

Adaptive Mesh Generation  
Uniform/Nonuniform Load Balancing

## Geometry

Cartesian Grid  
Refine/Coarsen Operators  
Time Interpolation

## Patch Data ✓

Cell  
Node  
Face  
Edge  
IndexData  
...

## Transfer ✓

Data Coarsen  
Data Refine & Boundary Fill  
Communication Schedules  
Message Streams

## Hierarchy ✓

Boxes  
Patches  
Variables  
Variable Database

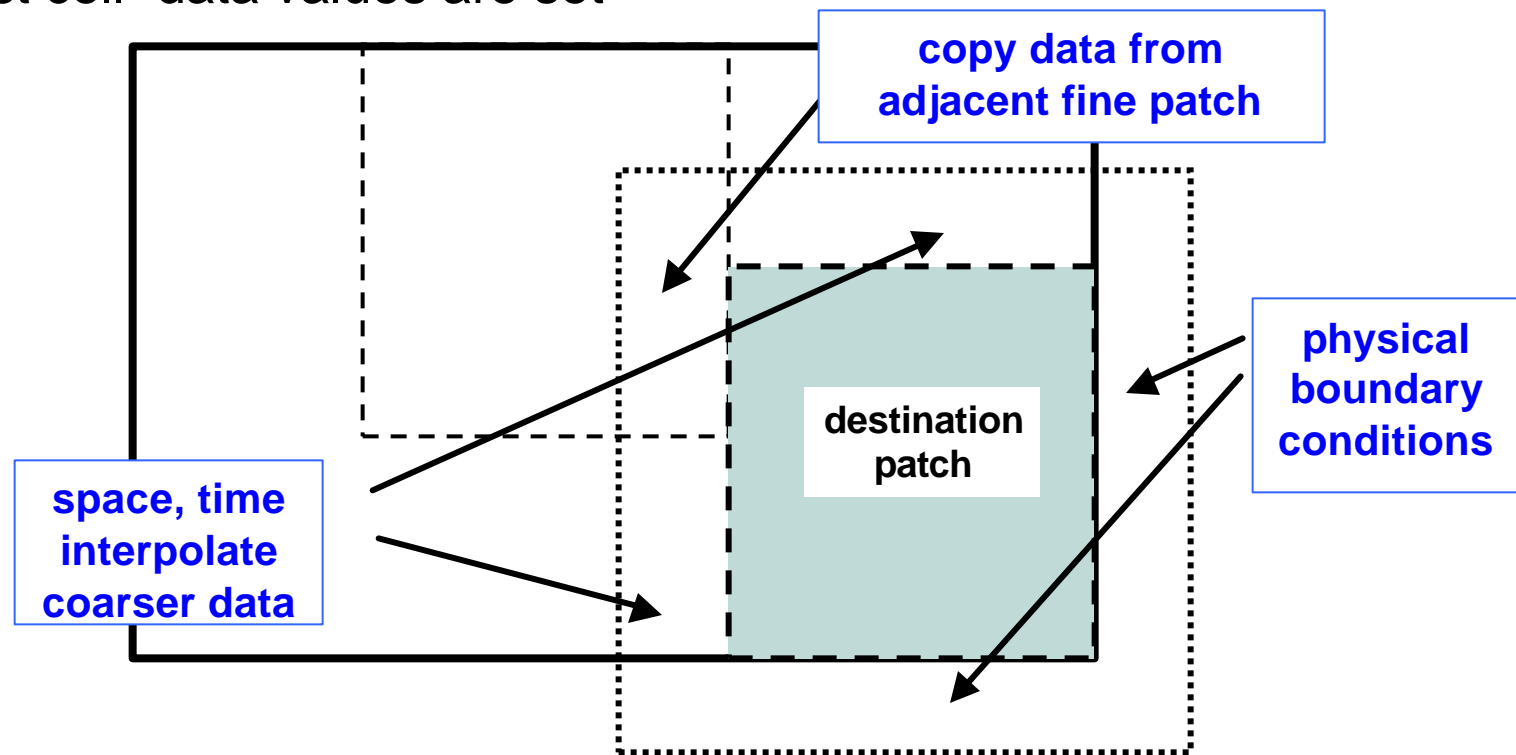

## Tool Box

Input Database  
Restart Database  
Performance Timers  
Smart Pointers  
Container Classes

# Data manipulation is dictated by solution algorithm and application needs

For example, before performing numerical operations on a patch, “ghost cell” data values are set

Typical SAMR data movement involves arbitrary combinations of variable quantities and operations

# SAMRAI abstractions capture application features and simplify data management

---

## Solution algorithms tend to be static

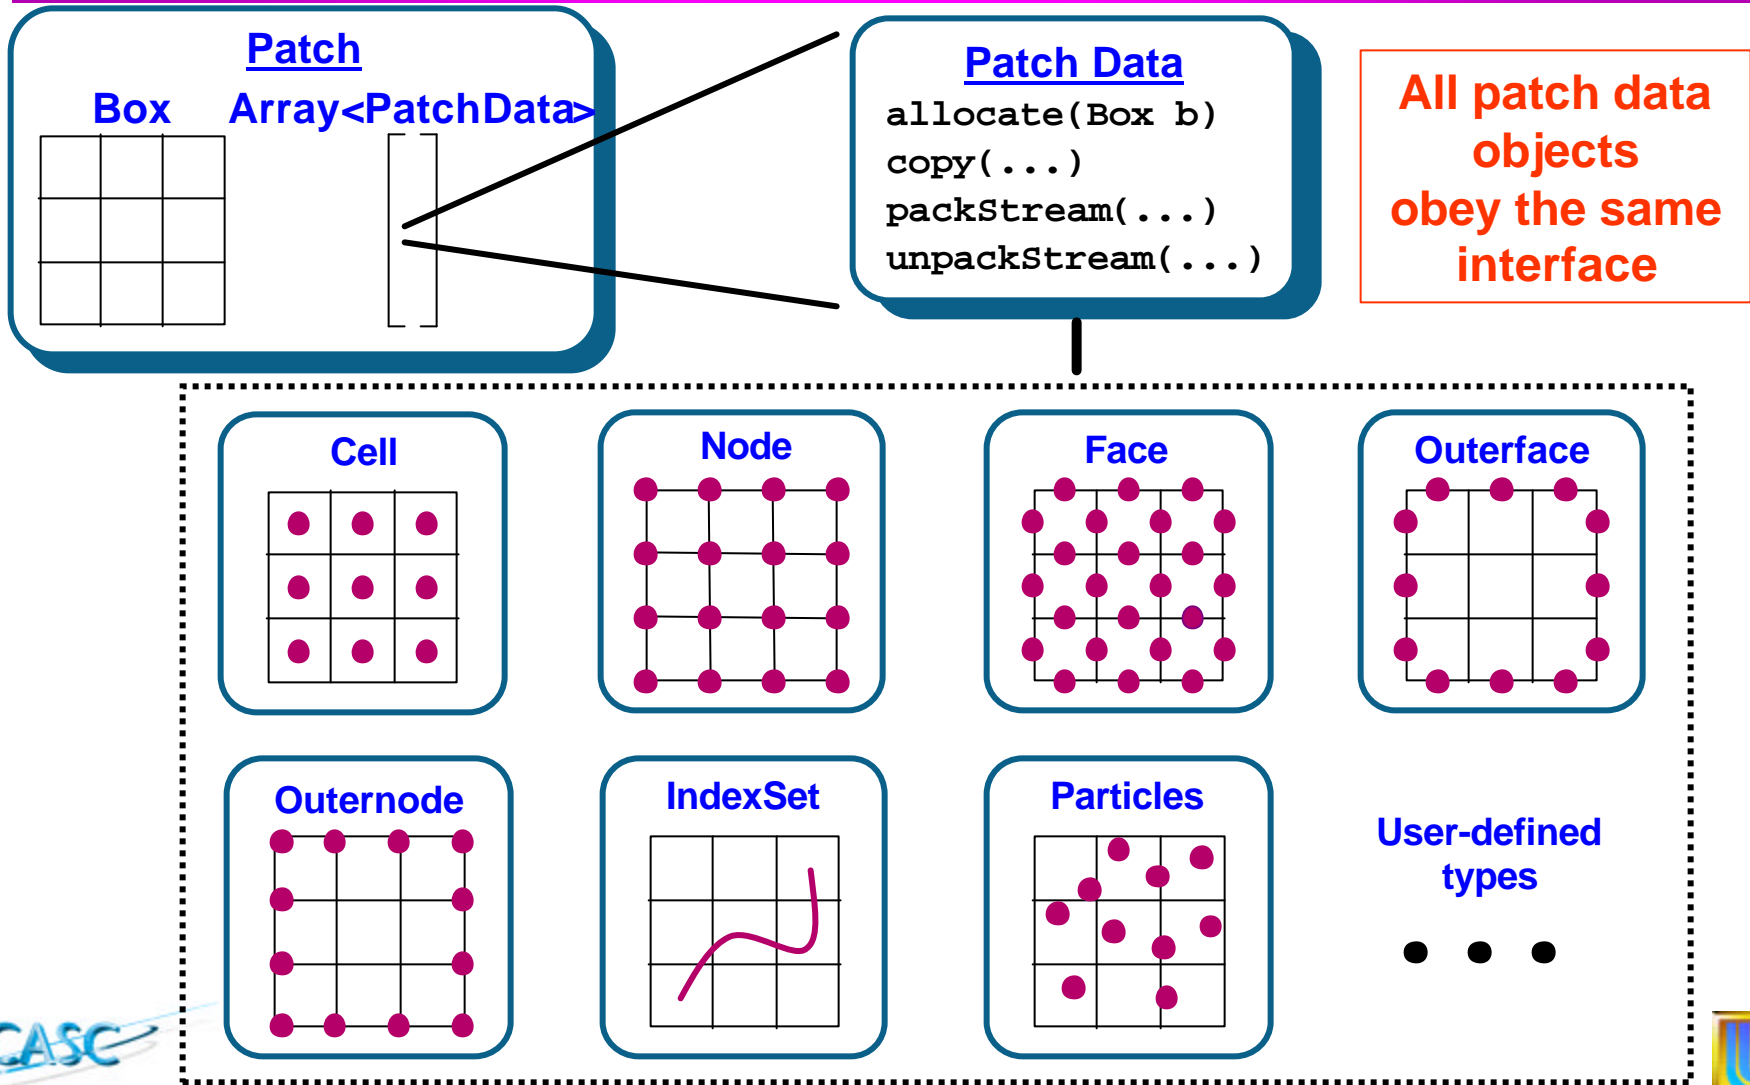

- **Variable**
  - defines a data quantity; centering, type, ...
  - creates data object instances (*abstract factory*)
- **Communication algorithm**
  - describes data transfer phase of a computation
  - expressed using variables, operators, ...
  - independent of mesh

## Mesh and data objects tend to be dynamic

- **Patch data**
  - represents data on a “box”
  - interface for data communication (*strategy*)
  - created by factory defined by variable
- **Communication schedule**
  - manages details of data movement
  - depends on mesh
  - created by communication algorithm

# SAMRAI “patches” contain all data living on a region of the computational mesh

# Communication algorithms describe data transfers needed for solution method

For example, integration of particle regions requires both continuum and particle boundary data for each patch

- Create algorithm to fill data  
`RefineAlgorithm fill_alg;`

- Register variable operations with algorithm:

- density refined from coarser, copied from fine, BCs set  
`fill_alg.registerRefine(rho_old, // destination  
rho_old, rho_new, // sources  
..., "CONSERVATIVE_INTERP");`

- particles copied from neighboring patches

```
fill_alg.registerRefine(particles, // destination  
particles, // source  
...);
```

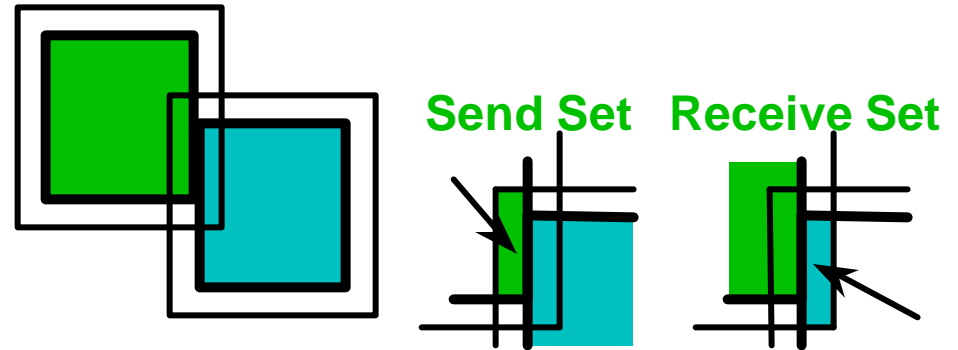

# Communication schedules create and store data dependencies

- Amortize cost of creating send/receive sets over multiple communication cycles

- Create schedule to fill data  

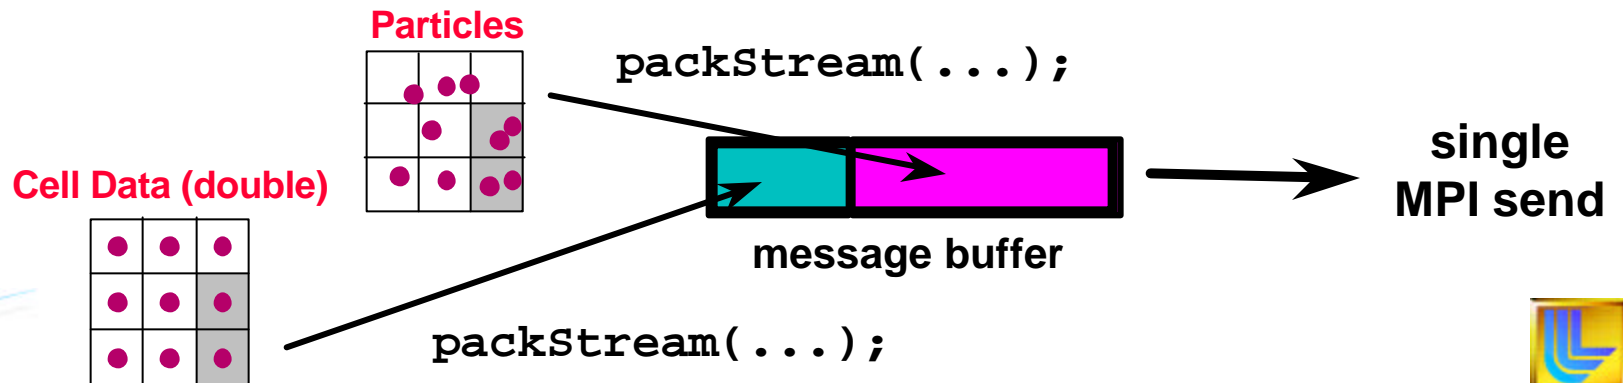

```
RefineSchedule fill_sched =  
    fill_alg.createSchedule(  
        hierarchy, level, ...);
```

- Data from multiple sources is packed into one message stream

- Invoke data fill operations  

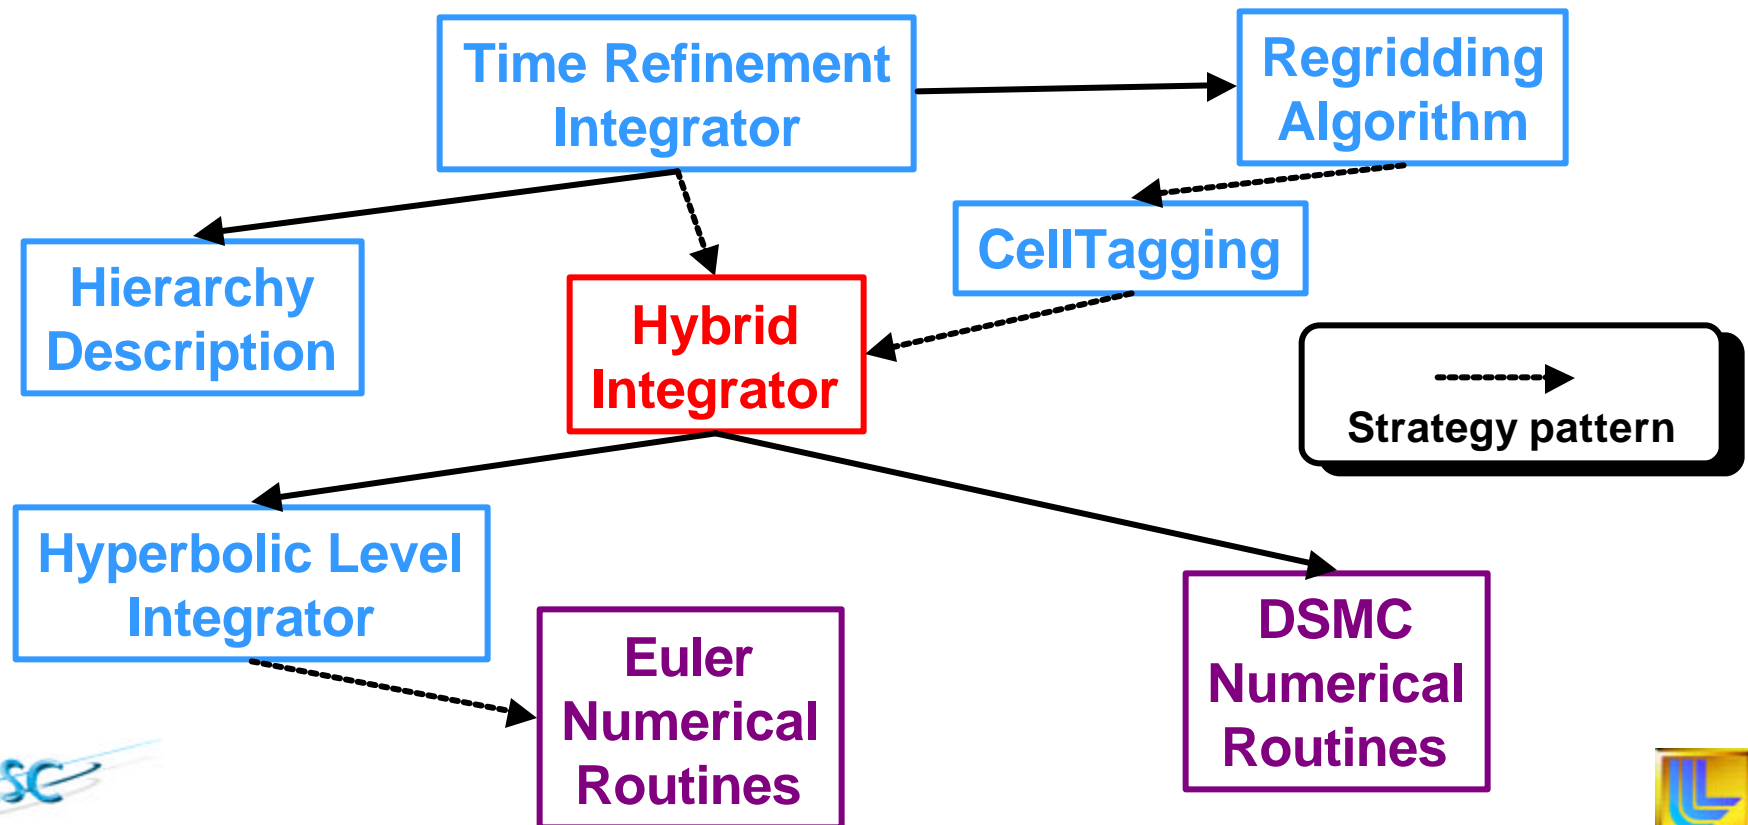

```
fill_sched.fillData(time, ...);
```

# Analysis of SAMRAI OO design features...

- Uncoupling variable, data, communication, mesh provides a lot of flexibility

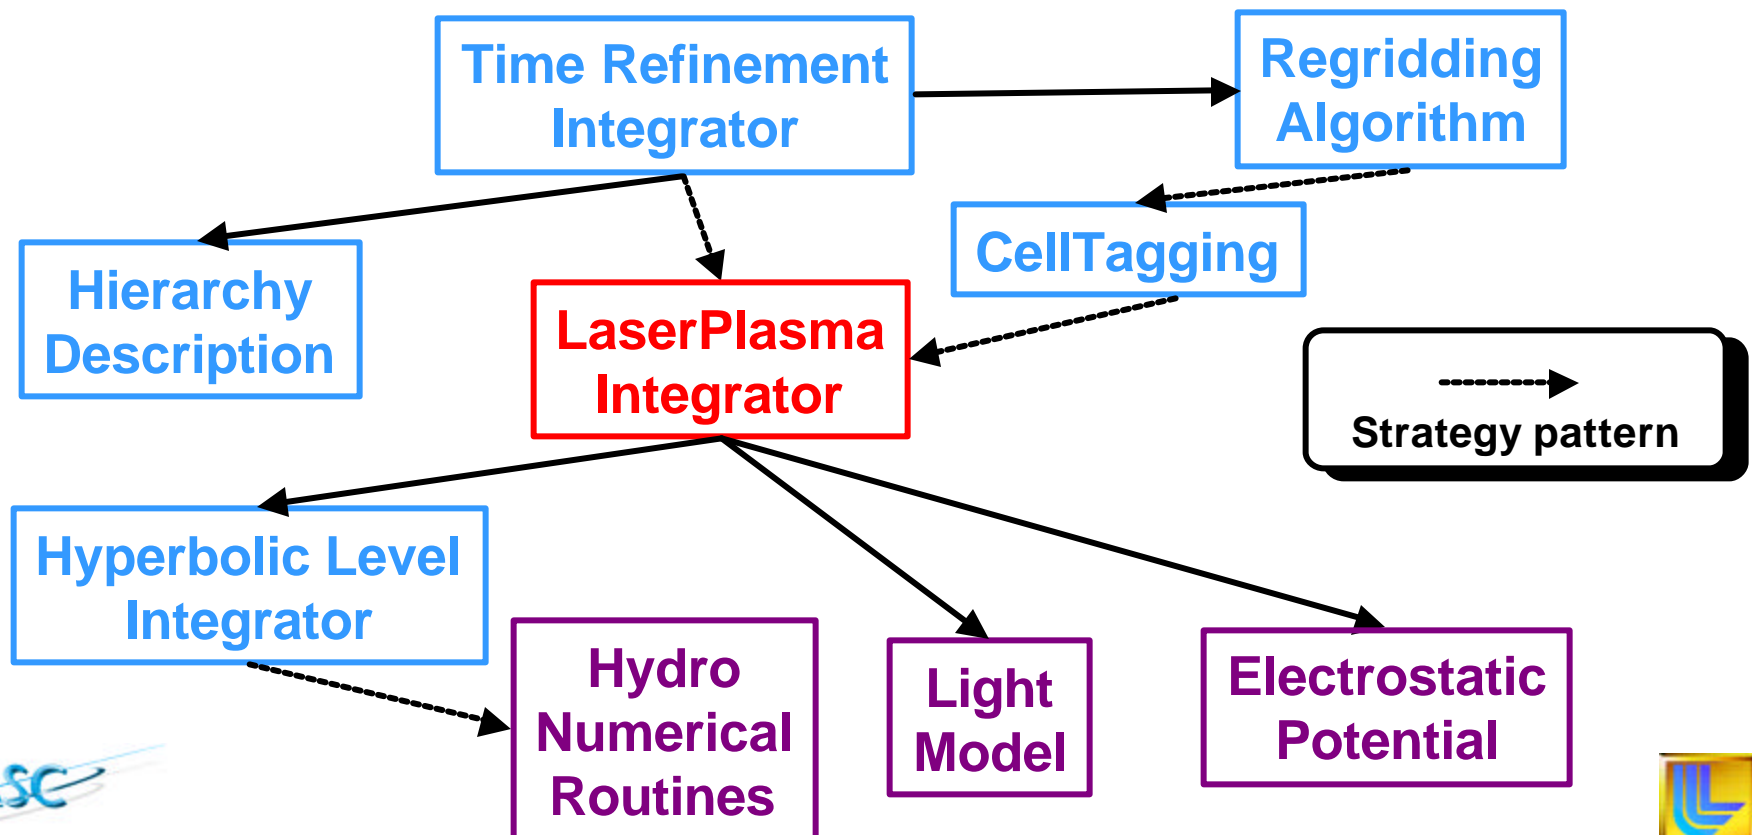

*“Strategy” supports extensible, specializable algorithms*

# Analysis of SAMRAI OO design features...

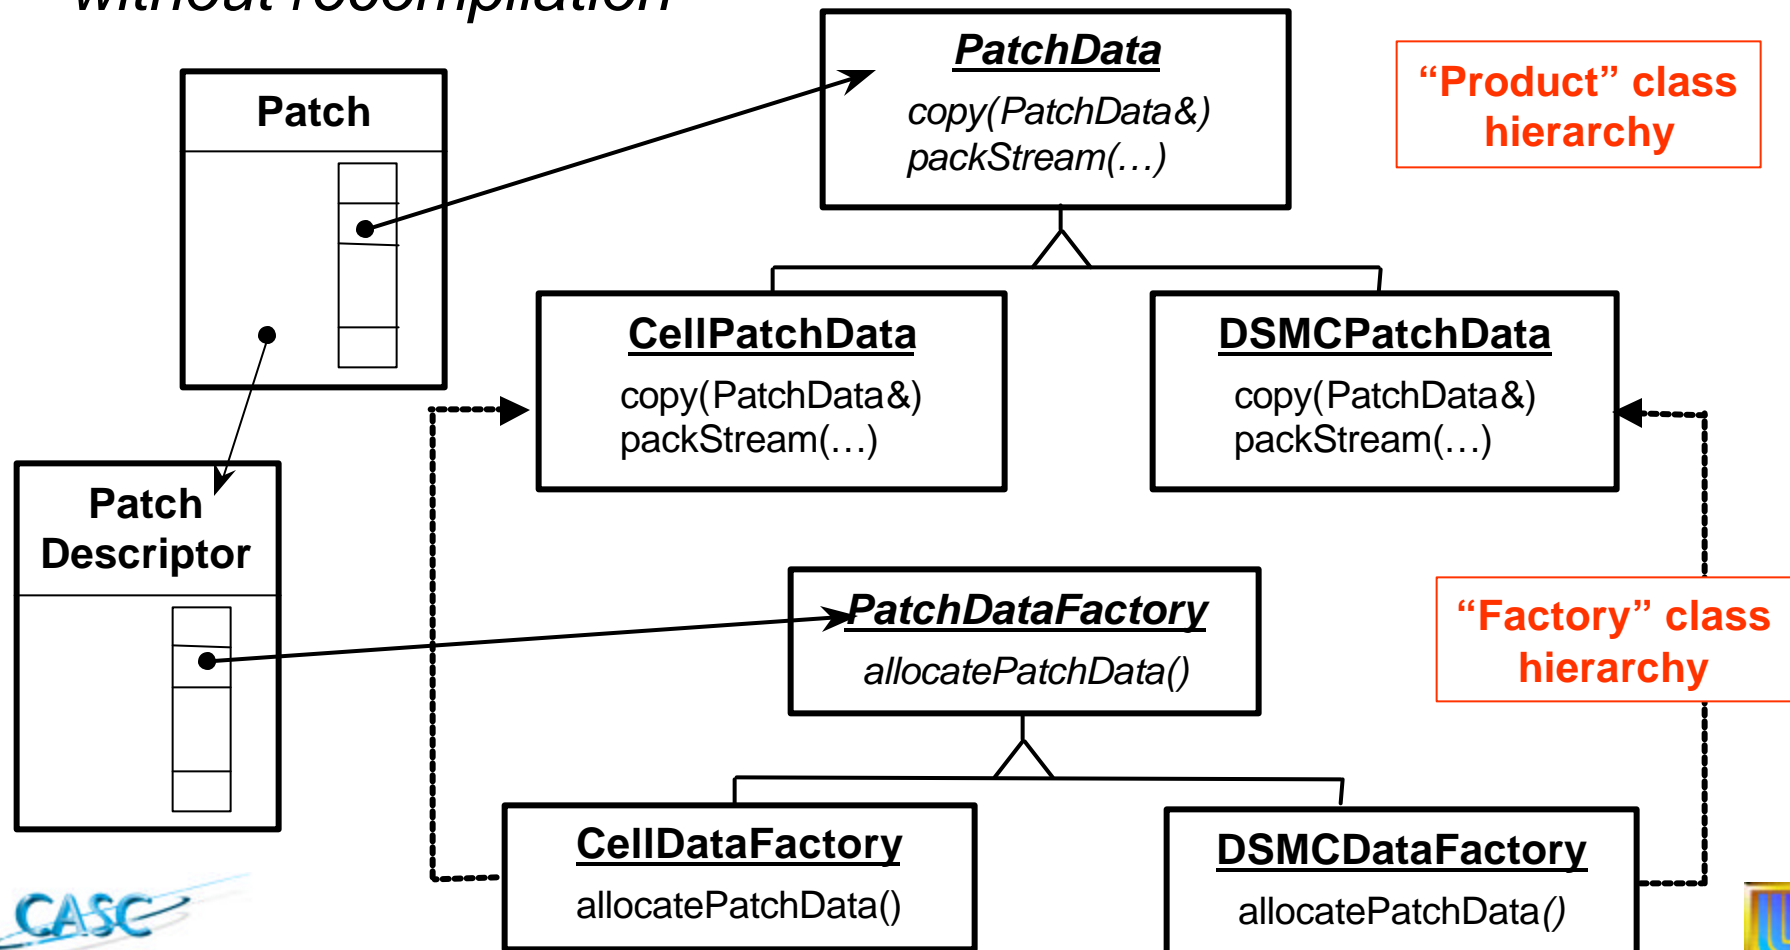

- Uncoupling variable, data, communication, mesh provides a lot of flexibility

*“Strategy” supports extensible, specializable algorithms*

# Analysis of SAMRAI OO design features...

*“Factory” pattern supports user-defined data types without recompilation*

# SAMRAI parallel framework supports new patch data types without recompilation

- Create a **DSMCDATA** subclass and provide virtual functions

```
class DSMCDATA : public PatchData
{
    void copy(...);
    void packStream(...);
    int getDataStreamSize(...)
    . . .
};
```

- Create a **DSMCFactory** subclass to allocate **DSMCDATA** objects

```
class DSMCFactory : public PatchDataFactory
{
    Pointer<PatchData> allocate(...);
    . . .
};
```

- Create **DSMCMVariable** subclass to create **DSMCFactory** objects

```
class DSMCMVariable : public Variable
{
    Pointer<PatchDataFactory> getPatchDataFactory(...);
    . . .
};
```

# Analysis of SAMRAI OO design features...

---

---

- **Design patterns, other OO techniques useful to manage complexity at a high level**
  - software architecture easier to understand (e.g., *strategy*, *abstract factory* ubiquitous)
  - inheritance model straightforward for users
- **Flexibility comes at a cost**
  - learning curve: pattern-based design at application level
  - uncoupling requires extra indirection
    - keep OO abstractions out of computation
    - need to understand where things are in library
  - early prototyping, user feedback essential

# Auspices Statement
