## Resumo

- Técnicas de proteção de informação sigilosa
- Autenticação do remetente e destinatário de documentos eletrônicos: assinatura digital/criptográfica
- Proteção de integridade de banco de dados
- Pretty Good Privacy – PGP
- Gnu Privacy Guard - GPG

## Breve histórico

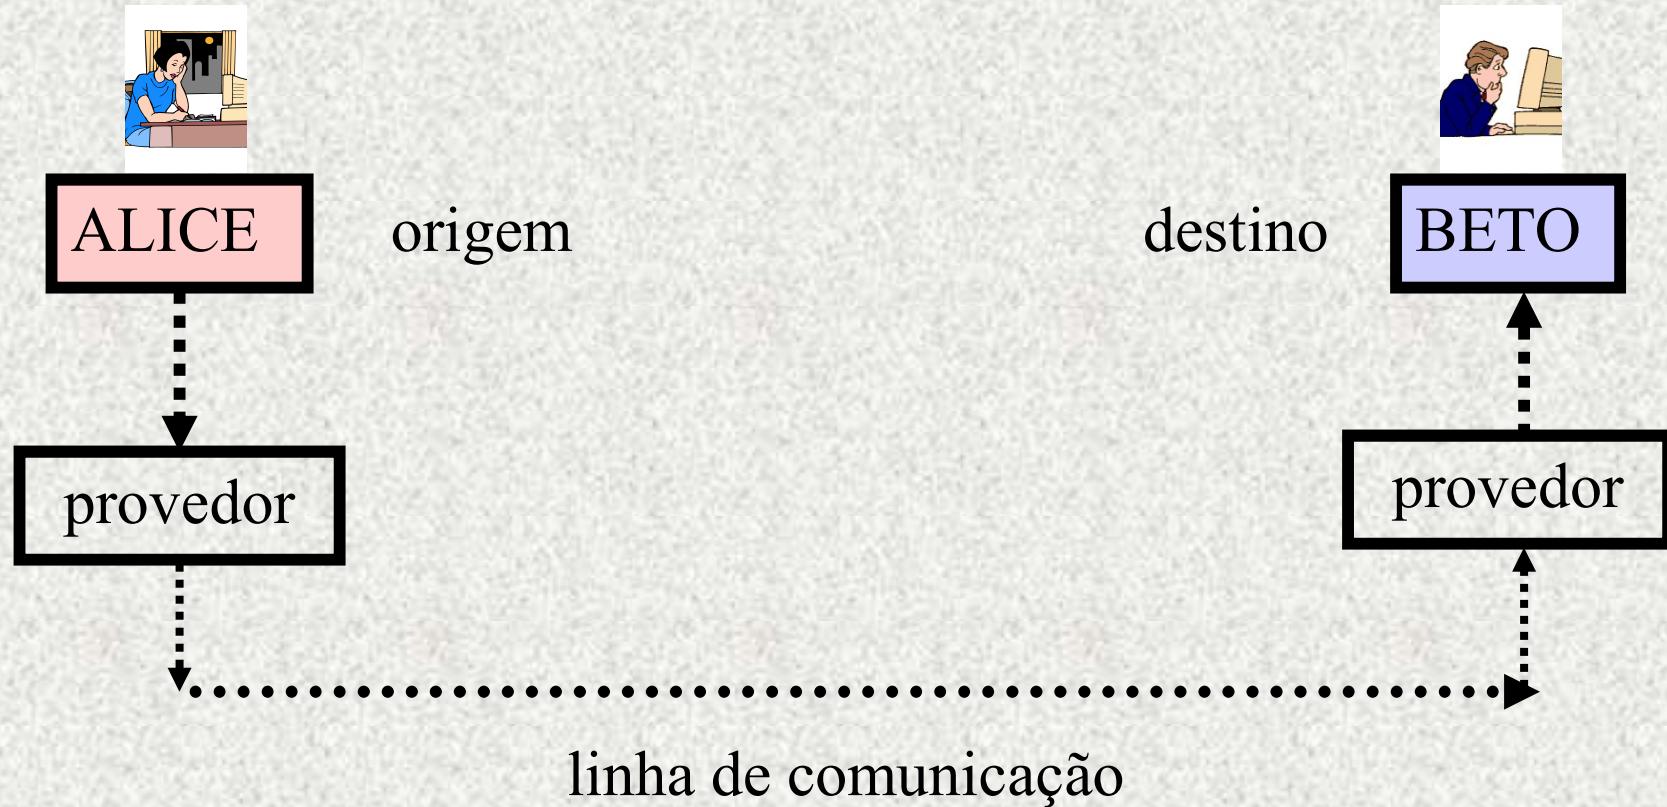

- Algoritmos eram *secretos* até meados de 1970
- Década de 1970: algoritmos DES e RSA *públicos*
- Segurança baseada *só* no segredo da chave
- Criptanálise dos algoritmos feita por *especialistas*
- Aprimoramentos sucessivos em (1) *segurança* e (2) *velocidade*

# Pesquisas Recentes

- Identity Based Encryption: chave pública pode ser, por exemplo, o no. CPF
- Certificateless Public Key Encryption: chave pública pode ser o endereço Email
- Computador quântico
- Criptografia quântica
- Criptografia pós-quântica

## Cenário geral

Objetivo: esconder info (como o número do seu cartão de crédito) de algum intruso na linha ou no provedor

# CIFRA DE CÉSAR

legível	A	B	C	D	E	F	G	H	I	J	K	L	M
ilegível	<u>D</u>	<u>E</u>	<u>F</u>	<u>G</u>	<u>H</u>	<u>I</u>	<u>J</u>	<u>K</u>	<u>L</u>	<u>M</u>	<u>N</u>	<u>O</u>	<u>P</u>
legível	N	O	P	Q	R	S	T	U	V	W	X	Y	Z
ilegível	<u>Q</u>	<u>R</u>	<u>S</u>	<u>T</u>	<u>U</u>	<u>V</u>	<u>W</u>	<u>X</u>	<u>Y</u>	<u>Z</u>	<u>A</u>	<u>B</u>	<u>C</u>

3 →

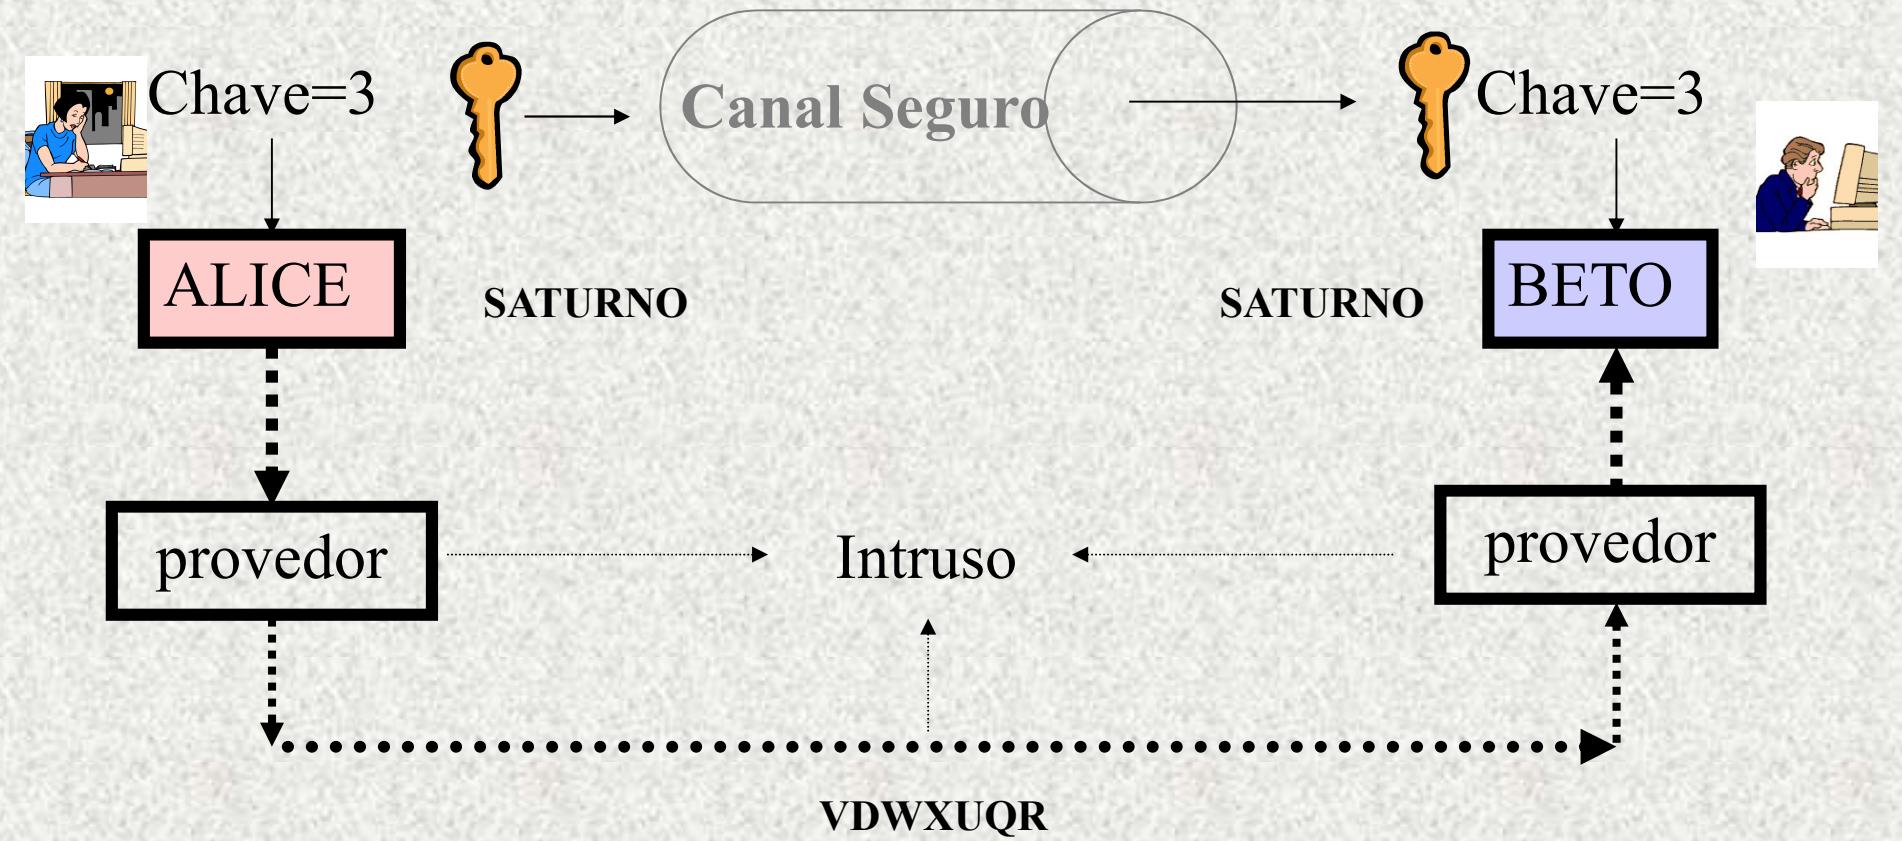

Chave=3

legível	S	A	T	U	R	N	O
ilegível	<u>V</u>	<u>D</u>	<u>W</u>	<u>X</u>	<u>U</u>	<u>Q</u>	<u>R</u>

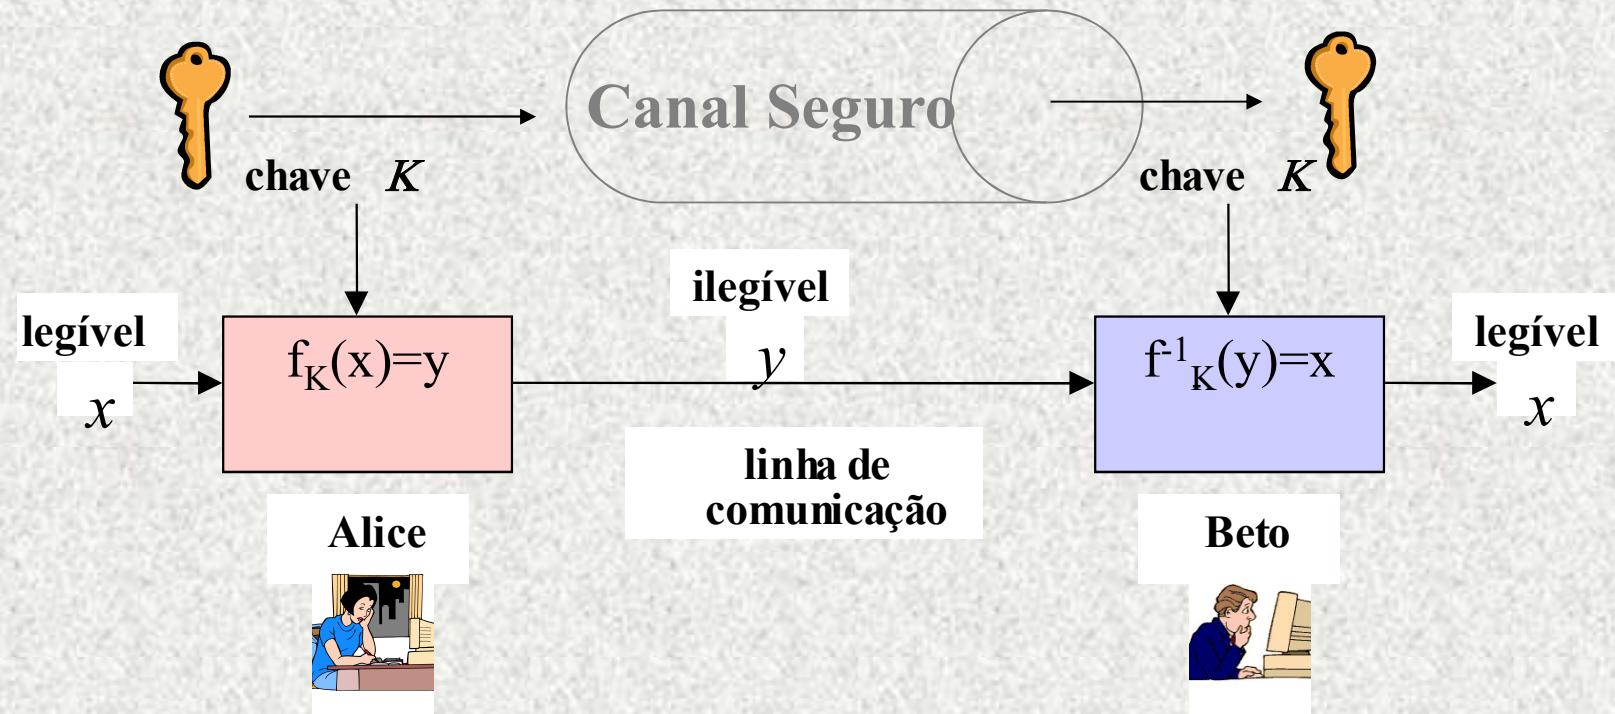

Total de 25 chaves, preserva frequência das letras, fraco

# Cifra de César

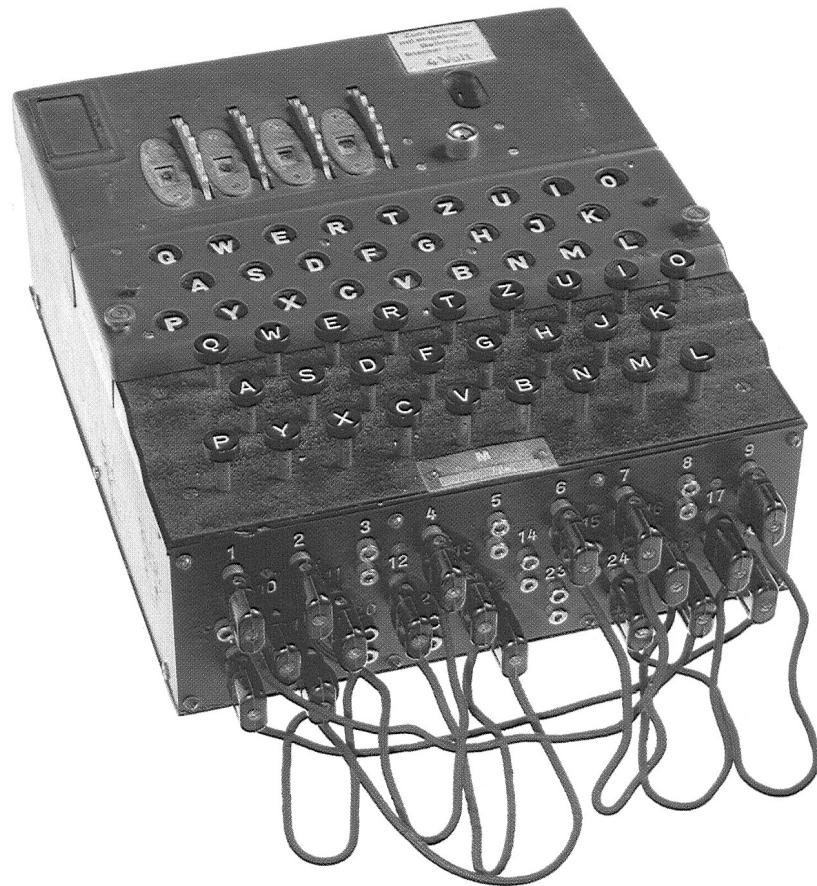

Objetivo: VDWXUQR ilegível para o Intruso

Formalmente tem-se uma função matemática e sua inversa

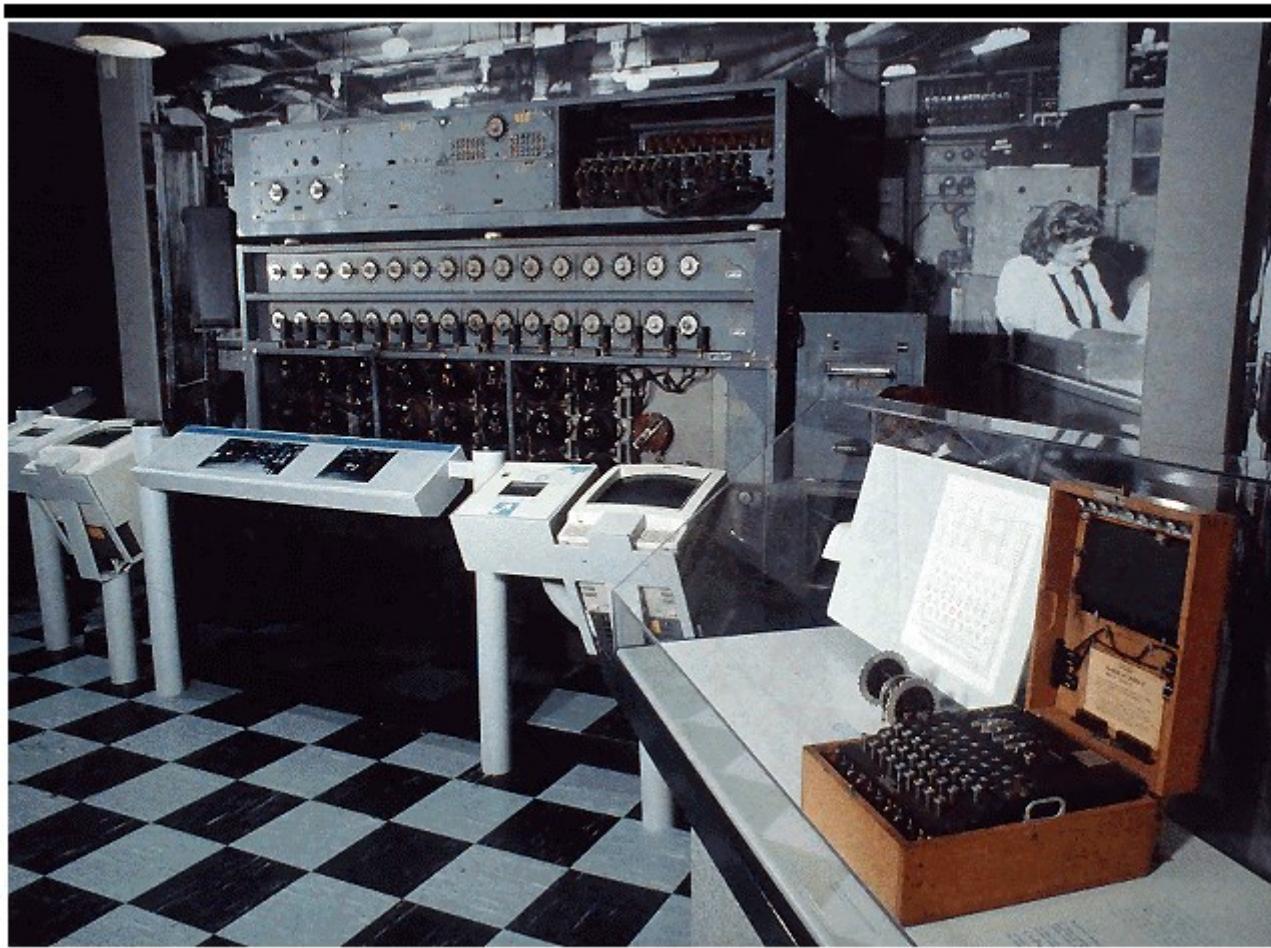

*Problema importante:* necessidade de combinar previamente a chave K de maneira totalmente segura  
 $N$  usuários  $\rightarrow N^*N$  chaves

## ENIGMA – máquina criptográfica alemã (II Guerra Mundial)

## ENIGMA e a máquina BOMBE

# Pontos importantes

- "insider" - maioria dos crimes eletrônicos causados por "insiders"
- tecnologicamente, manter um passo à frente dos criminosos
- só senha - proteção fraca
- insegurança eletrônica é invisível
- muitos crimes não deixam rastros

Como descobrir uma chave DES?  
 $2^{56}$  chaves possíveis

Criptanálise Diferencial –  $2^{47}$  tentativas  
Biham, Shamir, 1990       $(2^{56}/2^{47}=512)$

Criptanálise Linear –  $2^{43}$  tentativas  
Matsui, 1994       $(2^{56}/2^{43}=8.192)$

Outros algoritmos como o DES:

- IDEA pg 57
- SAFER pg 67
- RC5 pg 71
- RC6 pg 75
- FEAL pg 81
- AES → a seguir
- etc.

# Advanced Encryption Standard

AES

<http://csrc.nist.gov/encryption/aes>

128 bits de chave

Algoritmo	Organização
CAST-256	Entrust Technologies, Inc. (Carlisle Adams)
CRYPTON	Future Systems, Inc. (Chae Hoon Lim)
DEAL	Richard Outerbridge, Lars Knudsen
DFC	CNRS - Centre National pour la Recherche Scientifique - Ecole Normale Supérieure (Serge Vaudenay)
E2	NTT - Nippon Telegraph and Telephone Corp. (Masayuki Kanda)
FROG	TecApro Internacional S.A. (Dianelos Georgoudis)
HPC	Rich Schroepel
LOKI97	Lawrie Brown, Josef Pieprzyk, Jennifer Seberry
MAGENTA	Deutsche Telekom AG (Dr. Klaus Huber)
MARS *	IBM (Nevenko Zunic)
RC6 *	RSA Laboratories (Burt Kaliski)
RIJNDAEL *	Joan Daemen, Vincent Rijmen
SAFER+	Cylink Corporation (Charles Williams)
SERPENT *	Ross Anderson, Eli Biham, Lars Knudsen
TWOFISH *	Bruce Schneier, John Kelsey, Doug Whiting, David Wagner, Chris Hall, Niels Ferguson

(\*) cinco finalistas na competição (New York -NY, Abril 13-14, 2000)

## AES - Advanced Encryption Standard

\* sucessor do DES a partir de 2002 \*

NIST

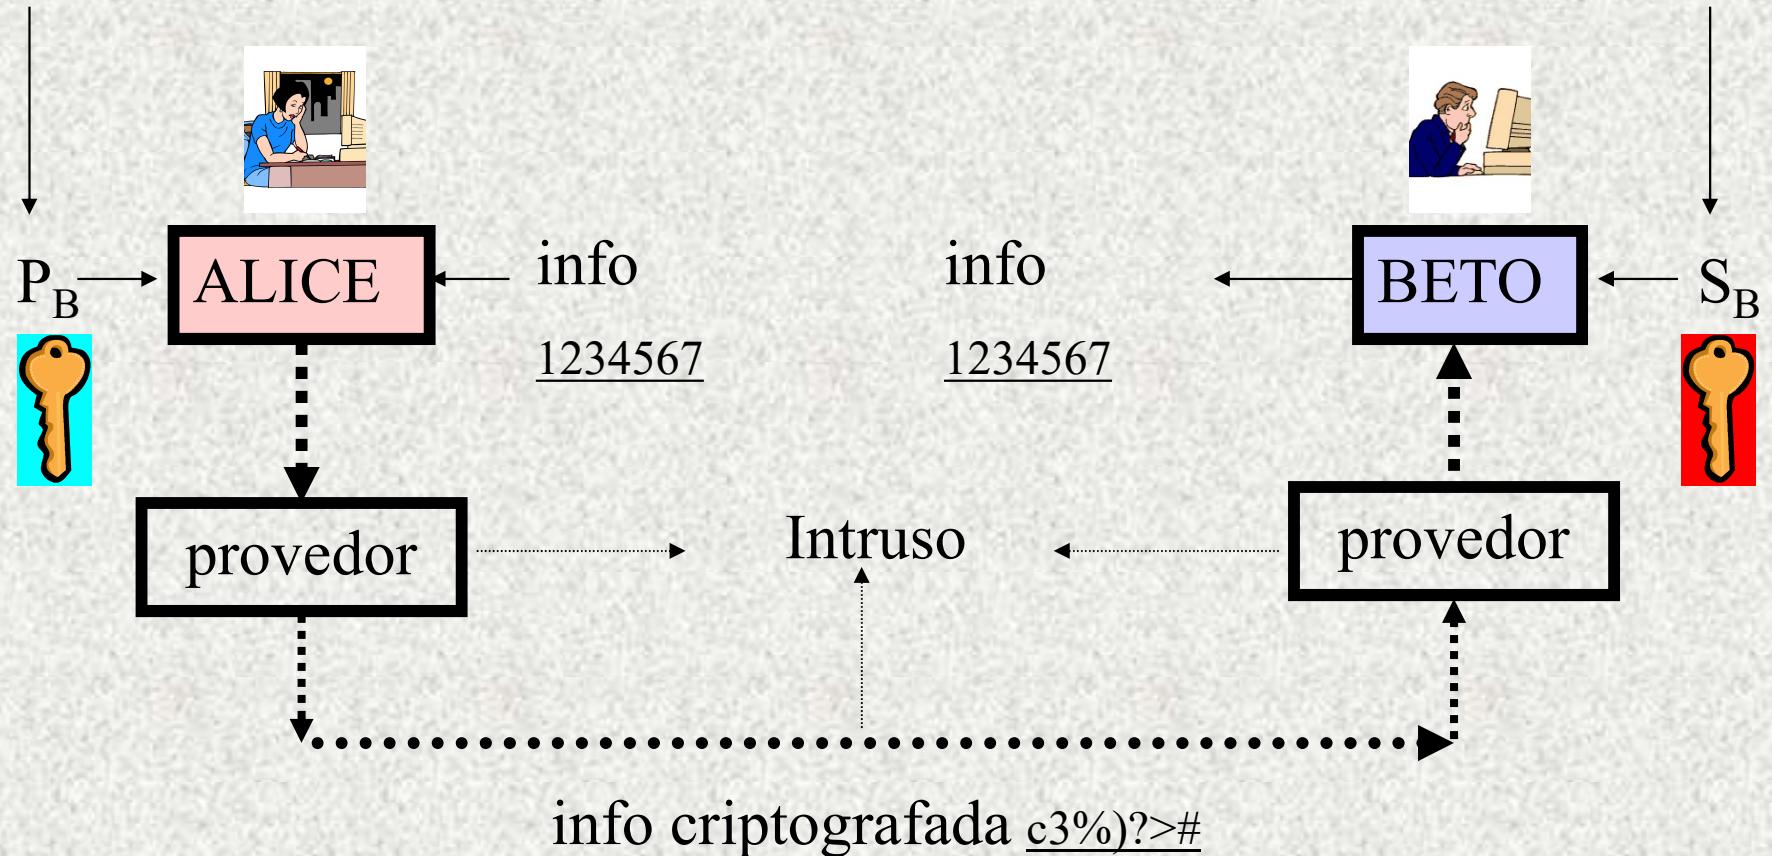

- Competição internacional **aberta** desde 1997
- Bloco de **128 bits** na entrada e na saída
- Chave de **128** ou **192** ou **256** bits
- Segurança e velocidade igual ou **superior** a *Triple-DES*
- Deve ser implementável eficientemente em soft/hard/**smart-card**
- RIJNDAEL -Joan Daemen, Vincent Rijmen

# Criptografia de Chave Pública (permite assinatura digital)

- Modelo de Diffie e Hellman (Stanford)
- Implementado no MIT por Rivest, Shamir e Adleman – RSA
- Outras implementações:
  - Rabin pg 117
  - El Gamal pg 120
  - Curvas Elípticas pg 130
  - MH -- Merkle Hellman pg 142
  - etc..

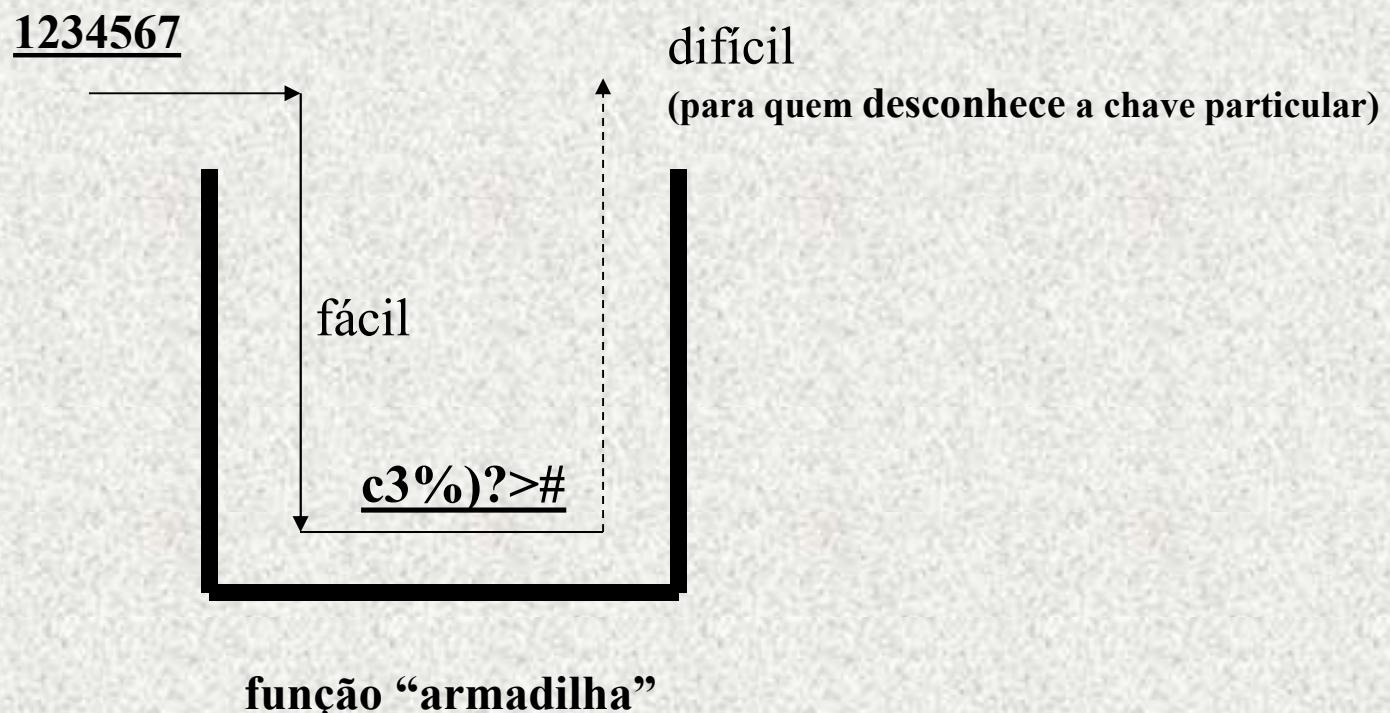

Chave *pública* do Beto

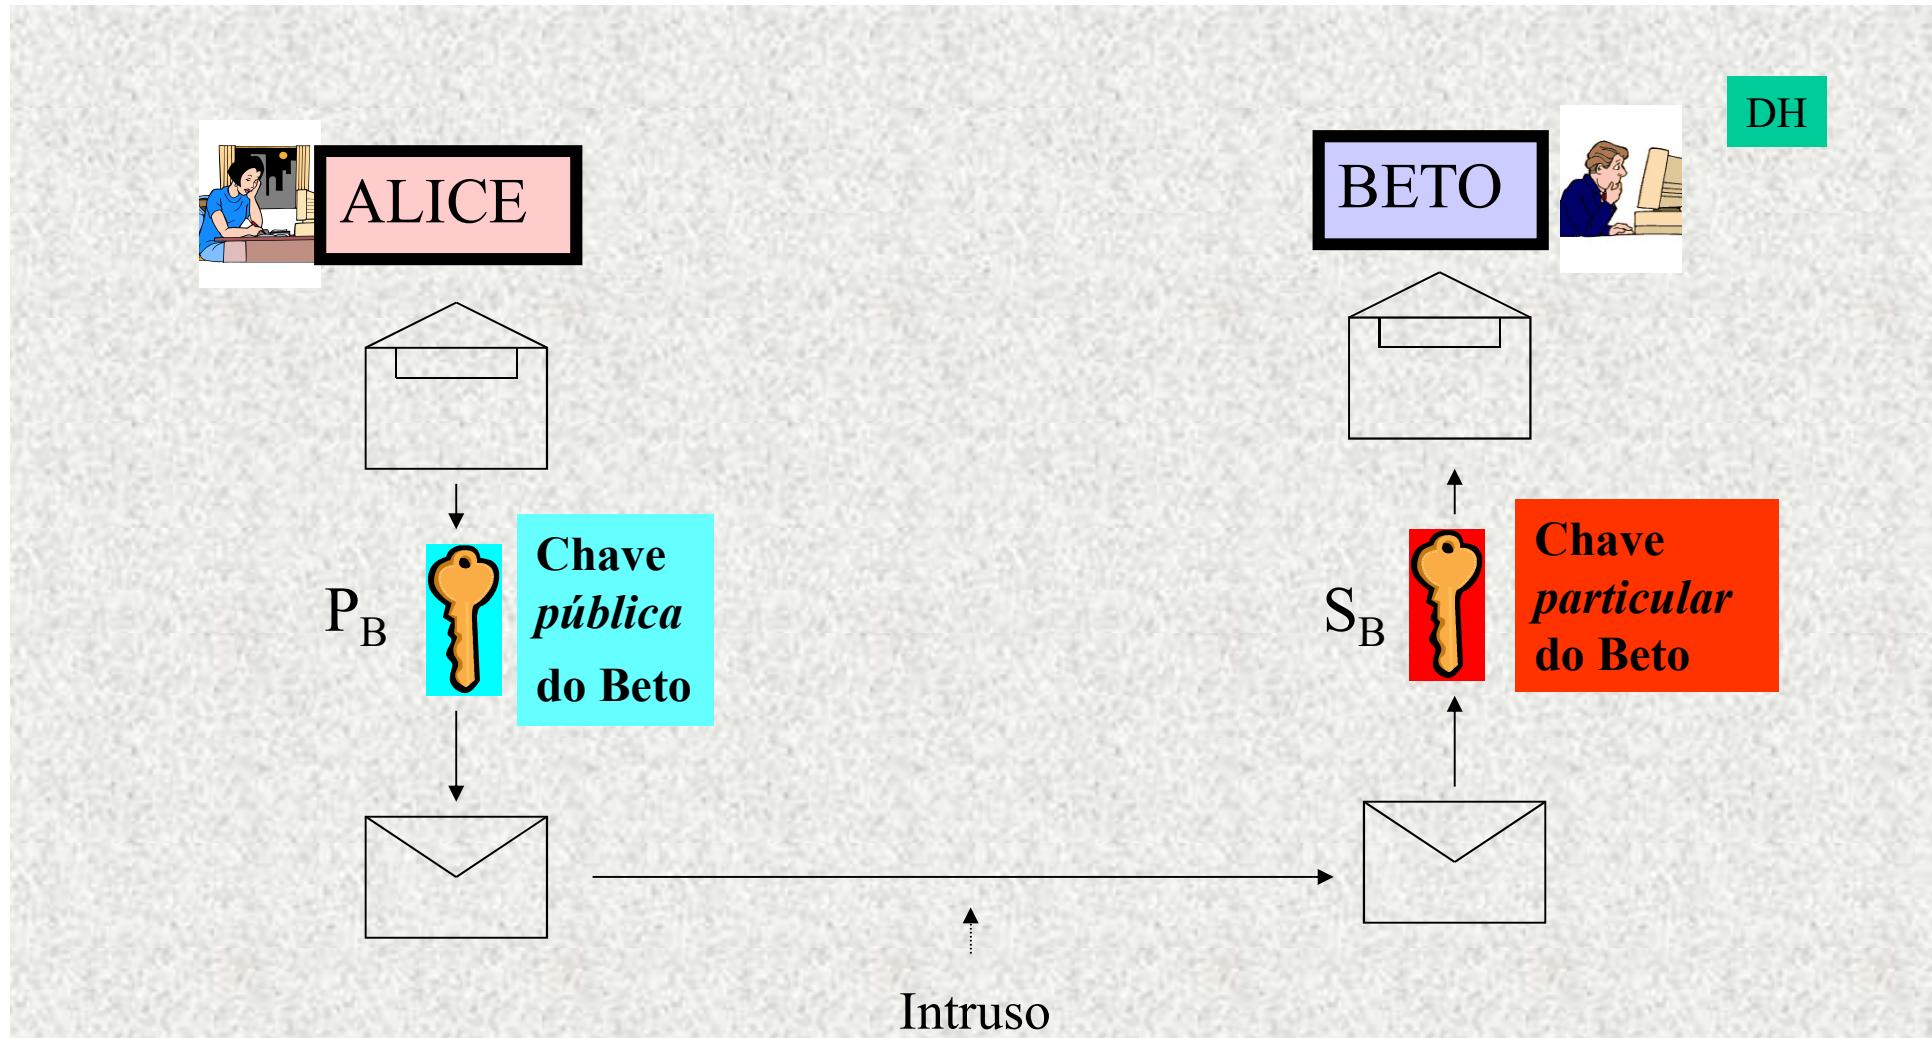

Chave *particular* do Beto

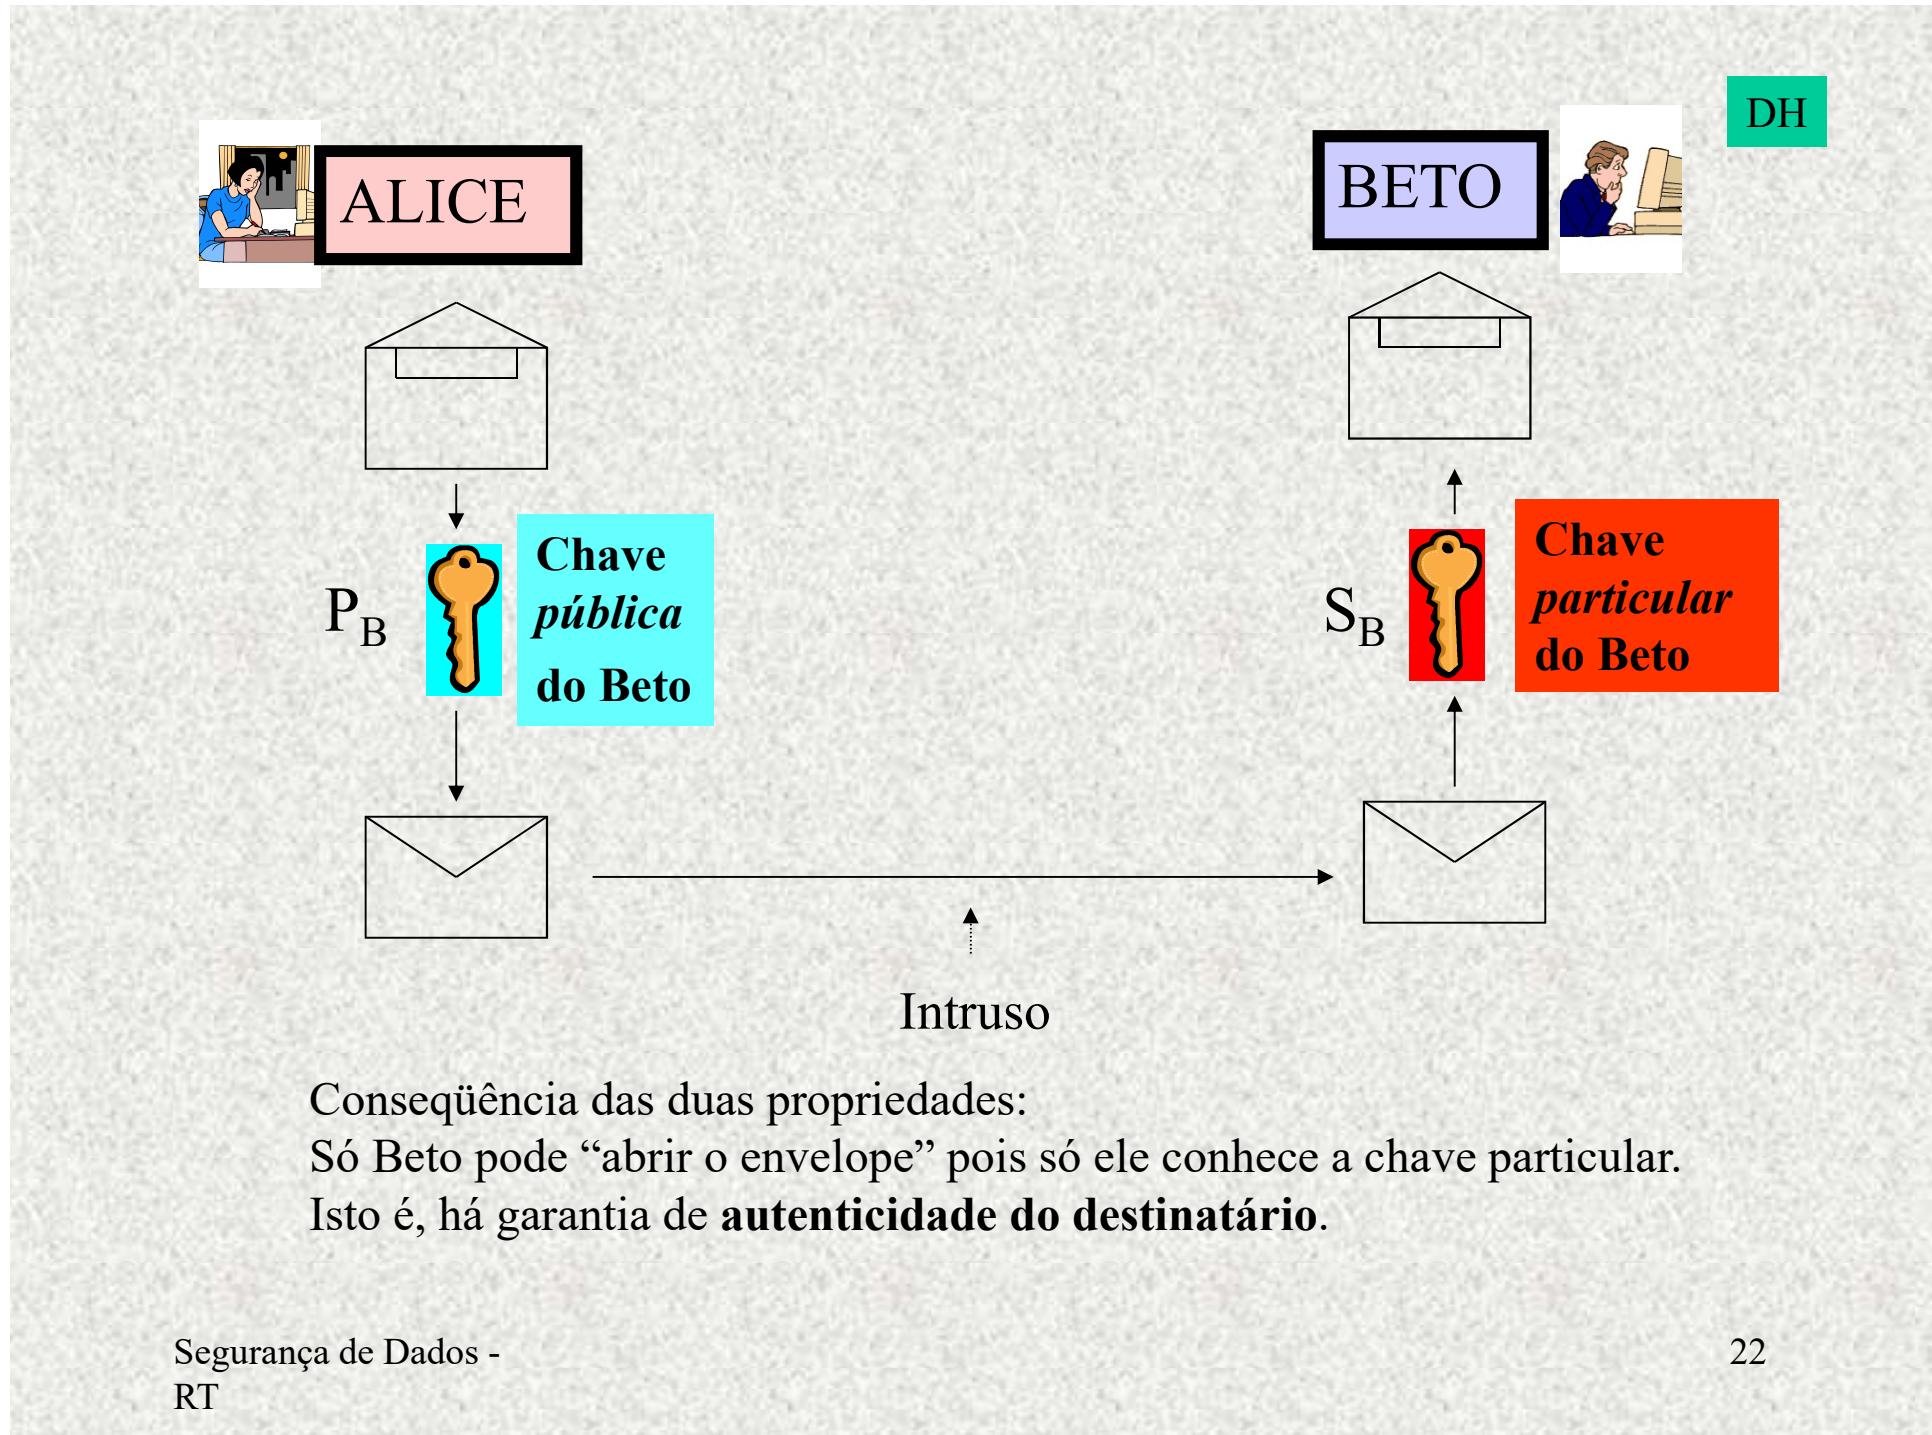

Objetivo: só Beto pode “abrir” a info.

## Conceito: one-way trapdoor function (função unidirecional alçapão)

- (1) É computacionalmente **inviável** calcular  $S_B$  a partir do conhecimento de  $P_B$
- (2) É computacionalmente **inviável** “abrir o envelope” sem conhecer  $S_B$ , mas é fácil “fechar o envelope” com a chave  $P_B$

Conseqüência das duas propriedades:  
 Só Beto pode “abrir o envelope” pois só ele conhece a chave particular.  
 Isto é, há garantia de **autenticidade do destinatário**.

## Observação importante:

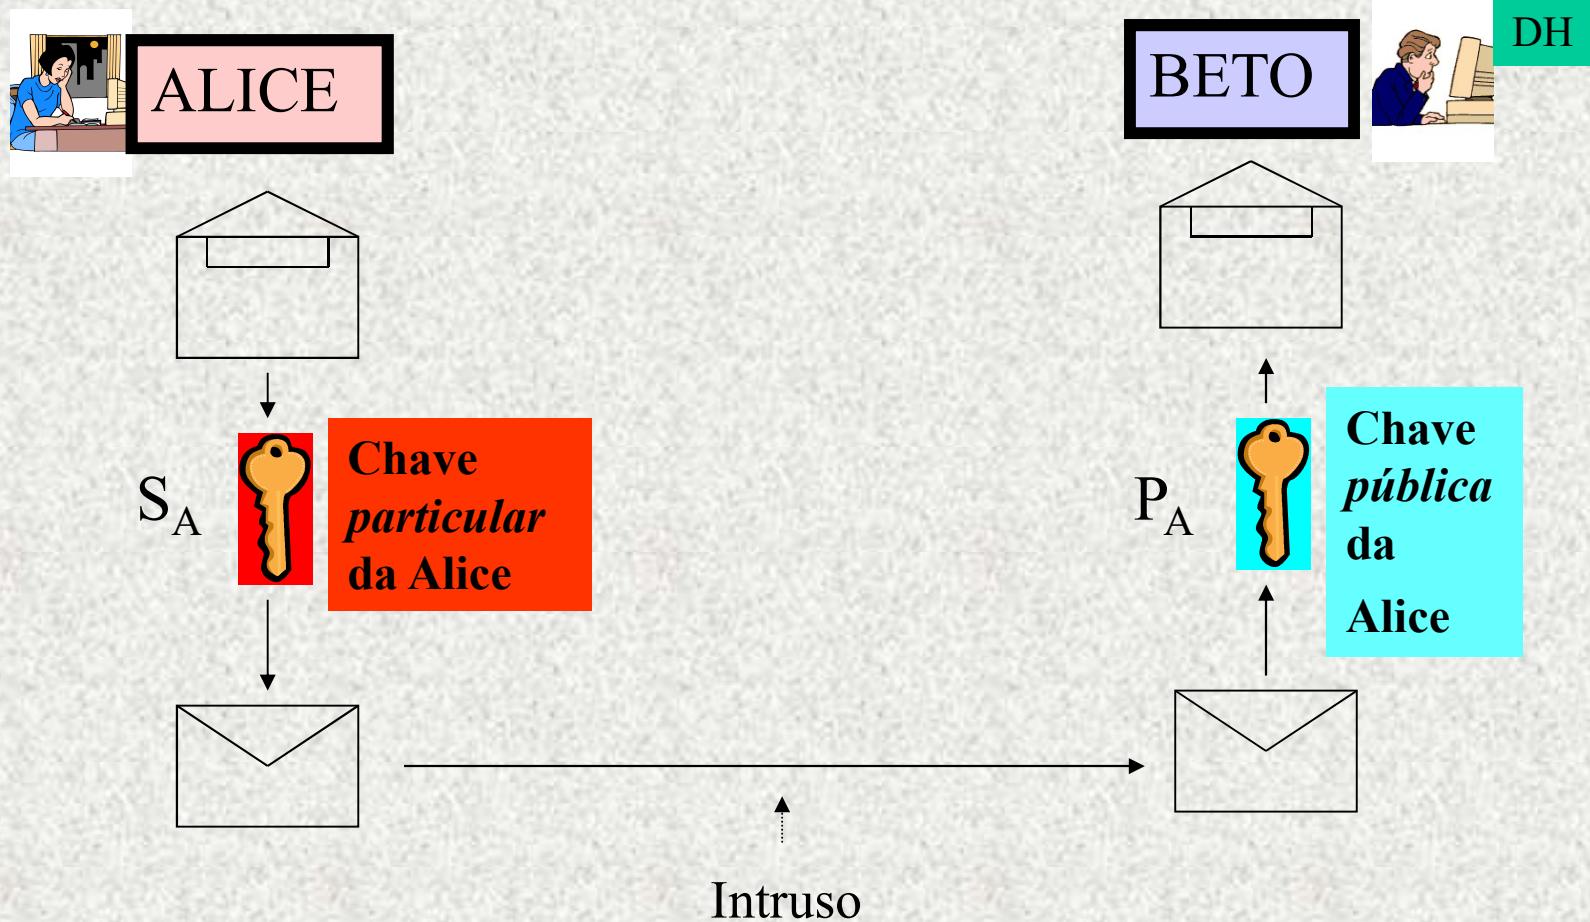

não há mais necessidade de se combinar previamente a chave secreta, de maneira segura (como necessário nos casos DES e AES) pois a chave pública pode ser até publicada como em lista telefônica.

### Lista de chaves públicas

....	
....	
Alice	821332001823410075
....	
Beto	773955910200231821
....	
....	

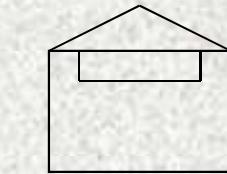

Idéia:  
“cartório  
eletrônico”

**Beto, por ex., calcula o seu par de chaves, guarda a particular no seu computador e publica a sua chave na Lista de chaves públicas.**

Propriedade adicional (terceira propriedade):

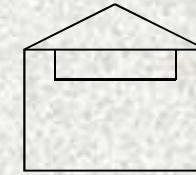

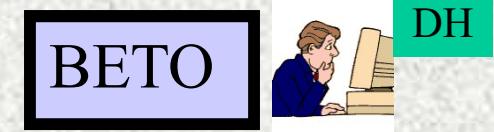

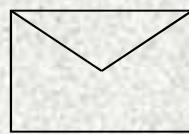

- (3) É possível aplicar “fechar o envelope” com a chave particular  $S_A$  e “abrir” com a chave pública  $P_A$

$S_A$

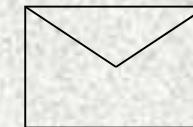

Chave  
*particular*  
da Alice

$P_A$

Chave  
pública  
da  
Alice

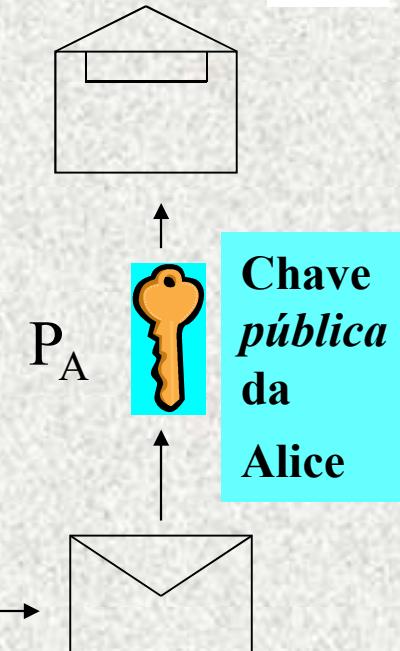

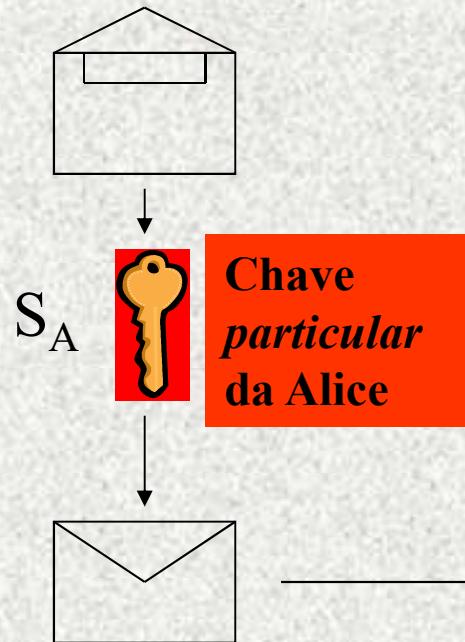

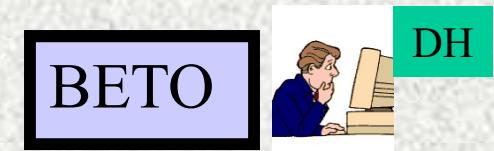

Conseqüência importante:

Beto sabe que só a Alice verdadeira pode ter enviado o envelope pois ele o abriu com a chave pública da Alice: **autenticação do remetente**  
É análogo a Alice ter “assinado” eletronicamente o envelope.

(observe que senha ou DES não autentica o remetente; por quê?)

## Não-repúdio

Outra conseqüência importante (não-repúdio):  
Alice não pode negar que tenha enviado, pois Beto usou a chave pública da Alice para abrir: **não-repúdio da informação**  
É análogo a Alice ter “assinado” um cheque.  
(observe que senha ou DES não possui esta propriedade; por quê?)

## Criptografia de chave pública

RSA- Rivest Shamir Adleman, 1978

**$q, r$  primos**

$$n = q \times r, \text{mdc}[s, (q-1)(r-1)] = 1, s \times p = 1 \bmod [(q-1)(r-1)]$$

**Exemplo:  $q=5, r=11, n=55, s=17, p=33, 17 \times 33 = 1 \bmod 40$**

Criptografar  $x$  com chave pública  $p$

$$x^p \bmod n = y$$

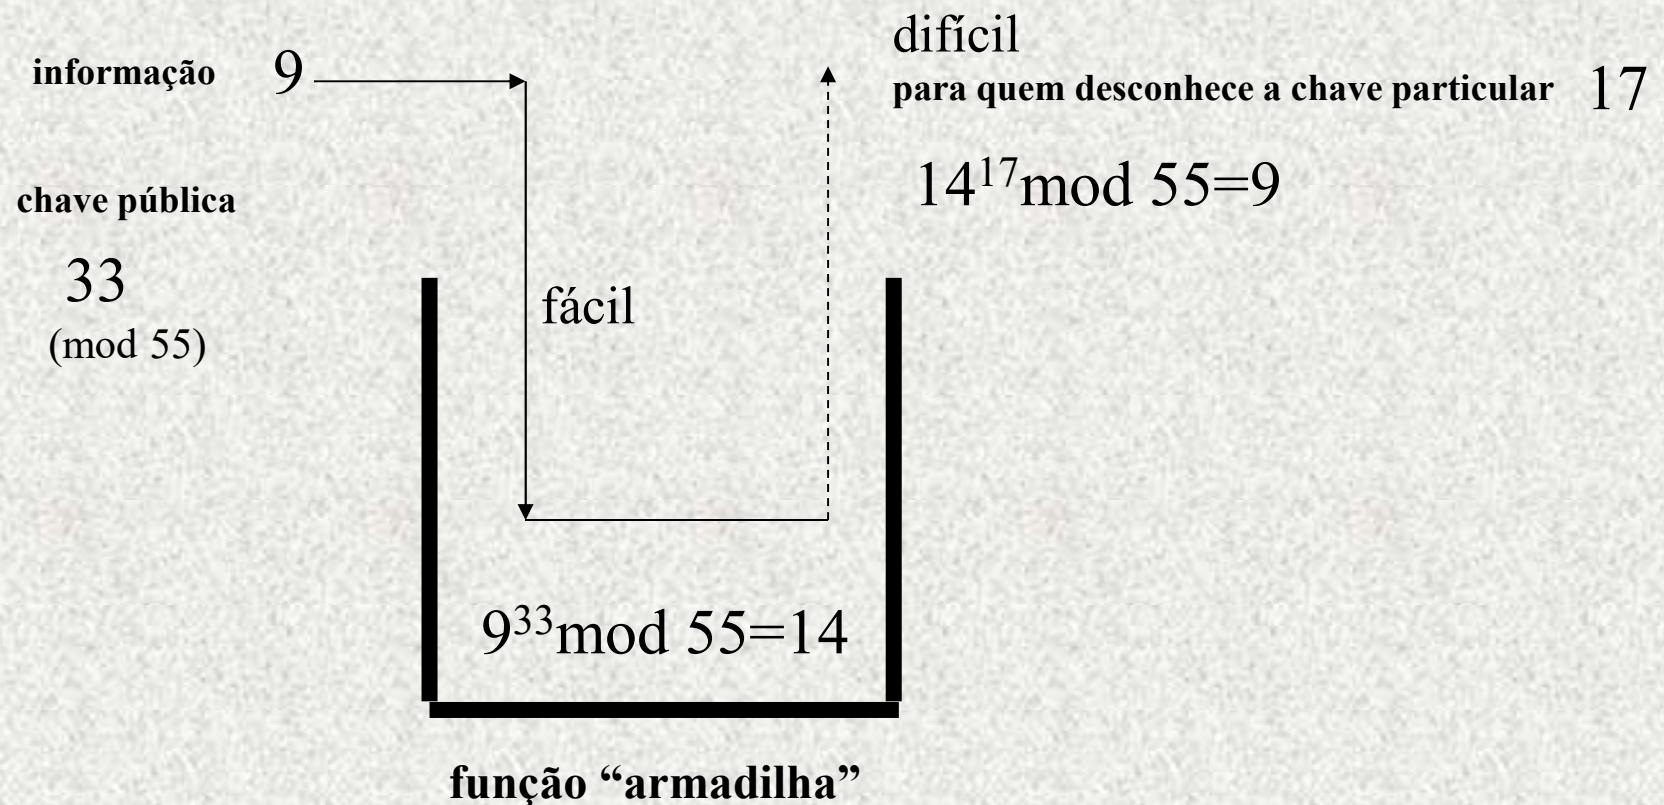

$$9^{33} \bmod 55 = 14$$

Decriptografar  $y$  com chave particular  $s$

$$y^s \bmod n = x$$

$$14^{17} \bmod 55 = 9$$

## Conceito: one-way trapdoor function (função unidirecional alçapão)

Quando  $x$  muda, assinatura  $y$  muda correspondentemente.

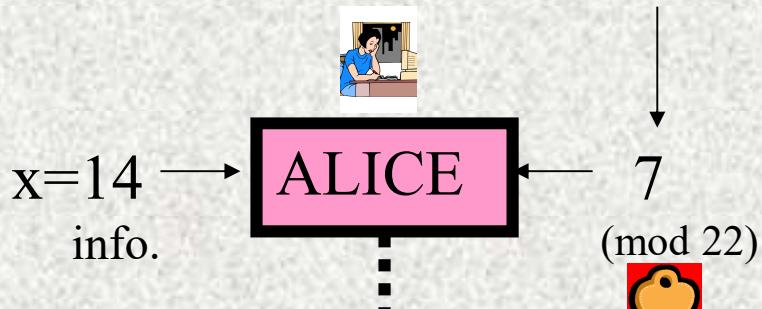

Exemplo a seguir

# Integridade da informação

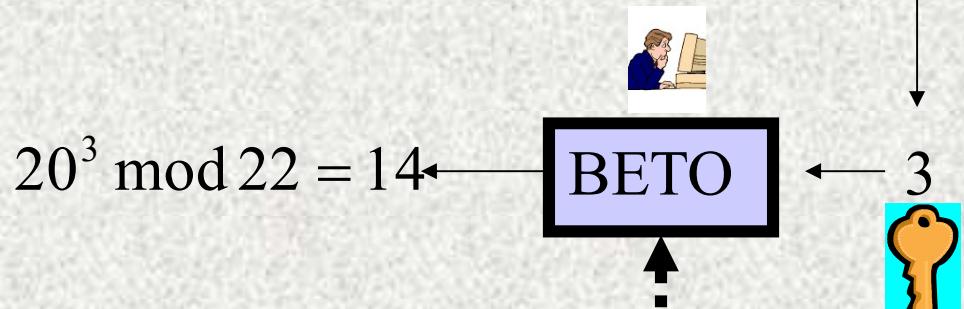

RSA

Exemplo:  $q=2, r=11, n=22, s=7, p=3, 7 \times 3 = 1 \bmod 10$

Chave particular  $s$  da Alice

Chave pública  $p$  da Alice

Alice usa a chave particular para assinar informação  $x=14$ , distinta de 9, anterior. A assinatura  $y=20$  é distinta de 15, anterior. Ou seja, quando  $x$  muda,  $y$  muda correspondentemente, e então a assinatura garante a *integridade da informação*  $x$ .

São Paulo, nn de dezembro de 1999.

Prezado Sr. Silva

Conforme ... autorizo o pagamento de 10 milhões .....  
de reais ...

Cordialmente,

Alice Cabral

78E829301FA44BA71228D3753AB2

Criação da assinatura, *com* a  
chave *particular* da Alice

A7762BFF9201BDEEB115294A88D

Assinatura criptográfica da Alice  
(128 bits)

Qualquer seq. de bits

$x$

Executável, imagem, etc.

RSA

Hashing( $x$ ) **Passo 1**

$f_s(x)$  **Passo 2**

$s$  é a chave *particular* da Alice

São Paulo, nn de dezembro de 1999.

Prezado Sr. Silva

Conforme ... autorizo o pagamento de 10 milhões .....  
de reais ...

Cordialmente,

Alice Cabral

78E829301FA44BA71228D3753AB2

Verificação da assinatura, *sem* a chave  
*particular* da Alice

A7762BFF9201BDEEB115294A88D

Assinatura criptográfica da Alice  
(128 bits)

Qualquer seq. de bits  
 $x$

RSA

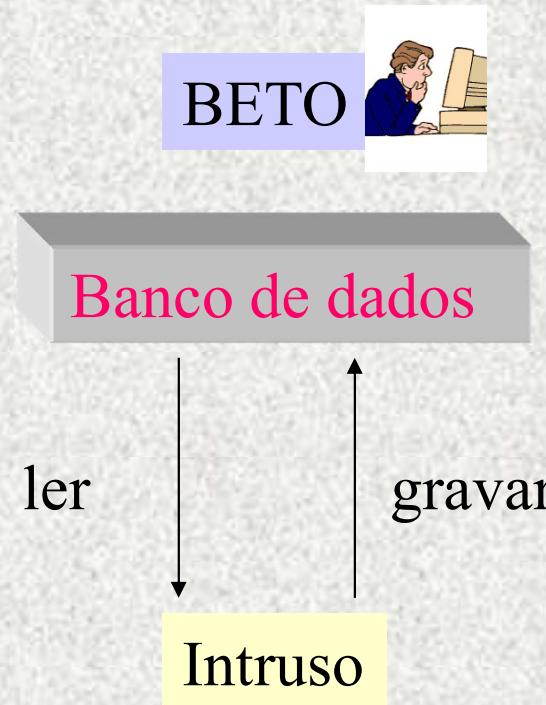

Hashing( $x$ )

**Passo 1**

$f_p(x)$

**Passo 2**

$p$  é a chave *pública* da Alice

Objetivo 1: garantir sigilo. Solução: criptografar

Objetivo 2: garantir integridade de info. Solução: assinatura criptográfica

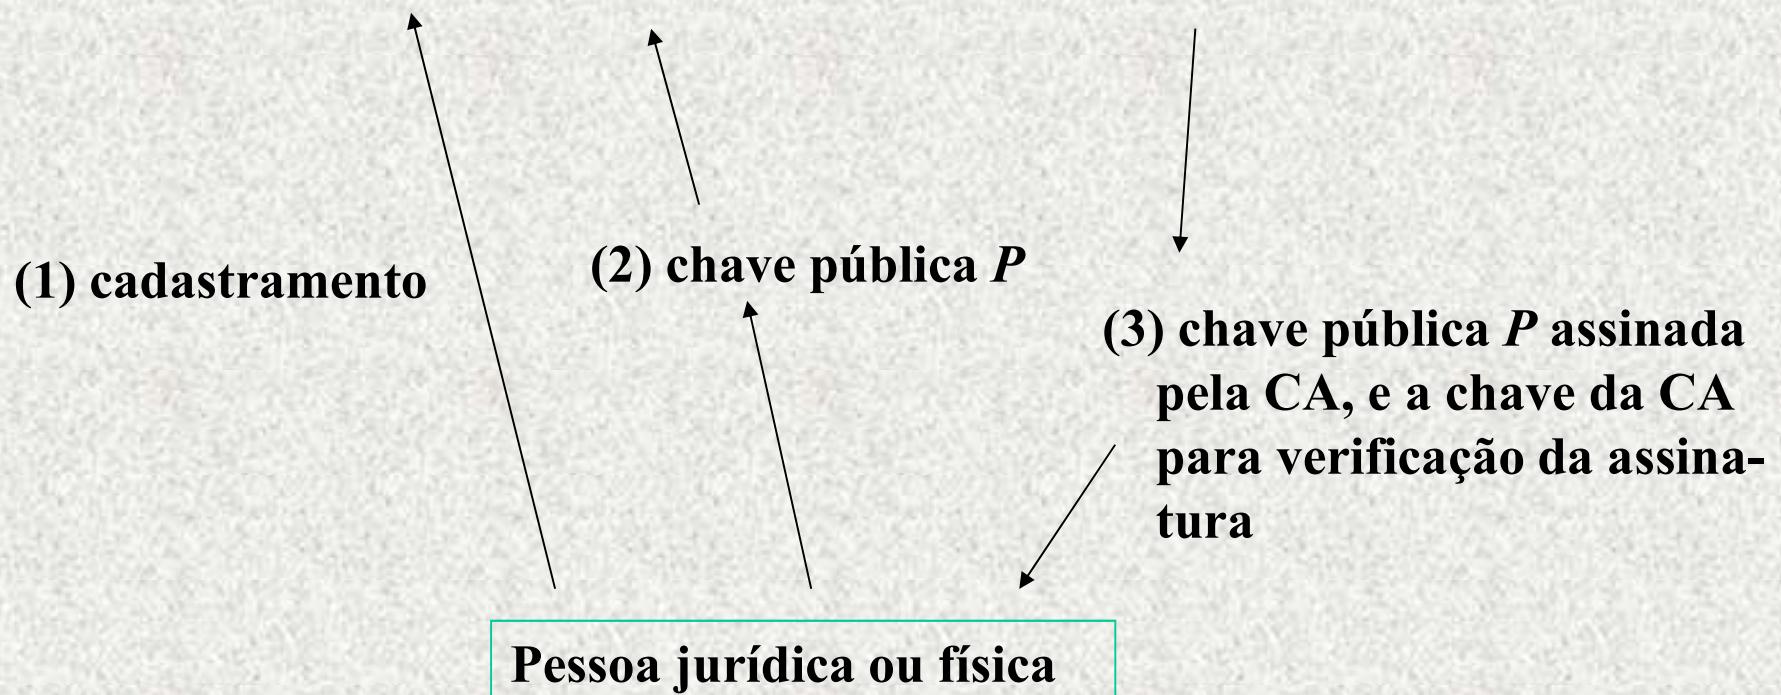

Como saber se aquela chave pública  
é de fato do legítimo dono?

A chave deve ser assinada por uma  
autoridade idônea

## PKI - Public Key Infrastructure

## ICP – Infraestrutura de Chave Pública

### CA - Certificate Authority ("cartório")

## Exemplo fictício de certificado

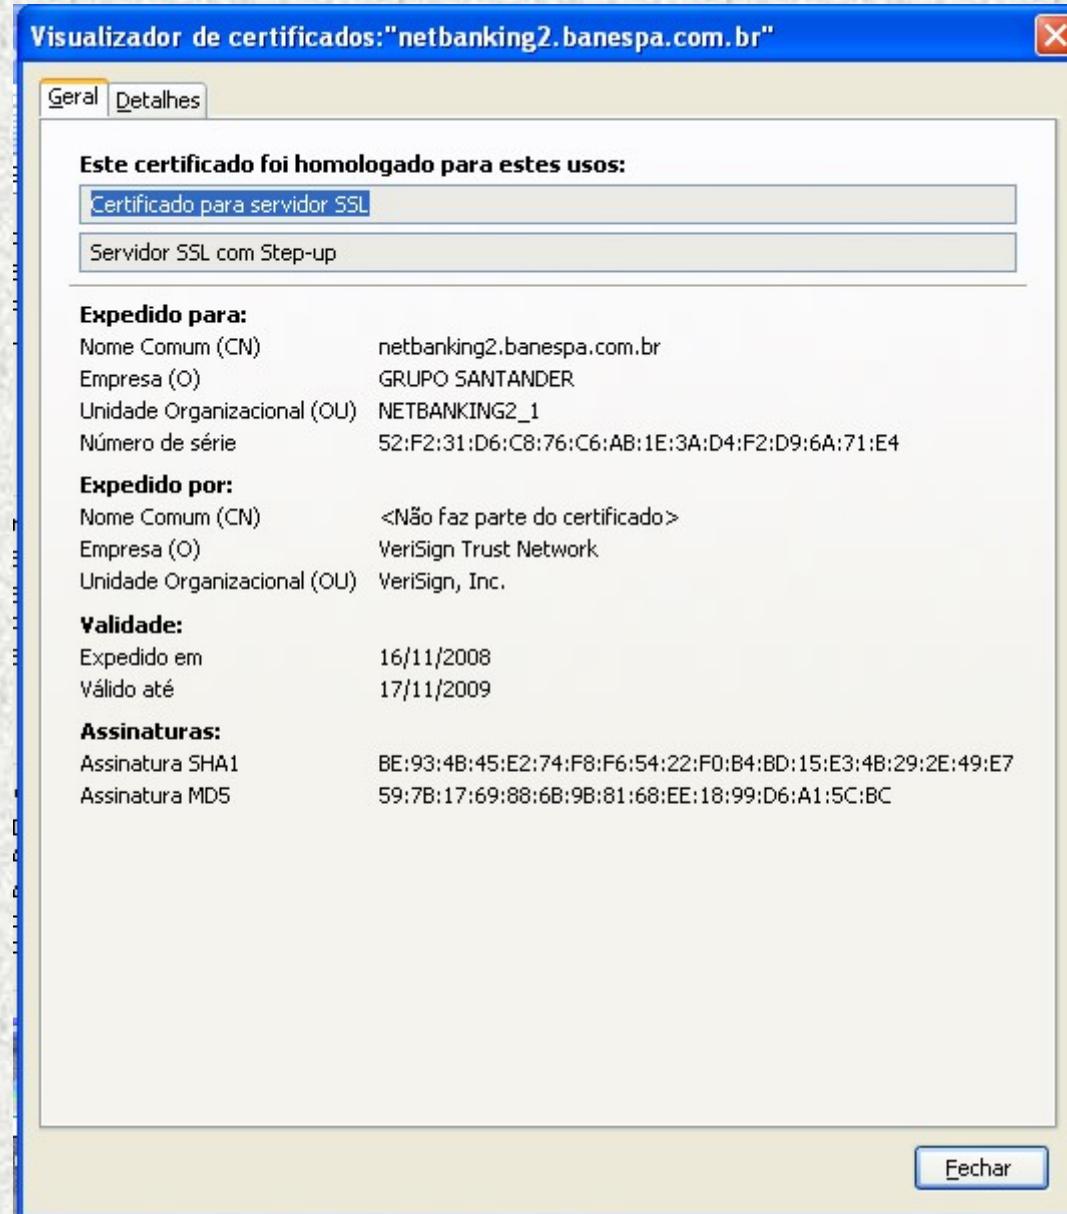

RSA

Serial Number: 102251  
Certificate for: Roberto Cabral  
Company: Oops Consultoria Ltda.  
Issued by: LeftSign Certificates

# Certificado

# Certificado

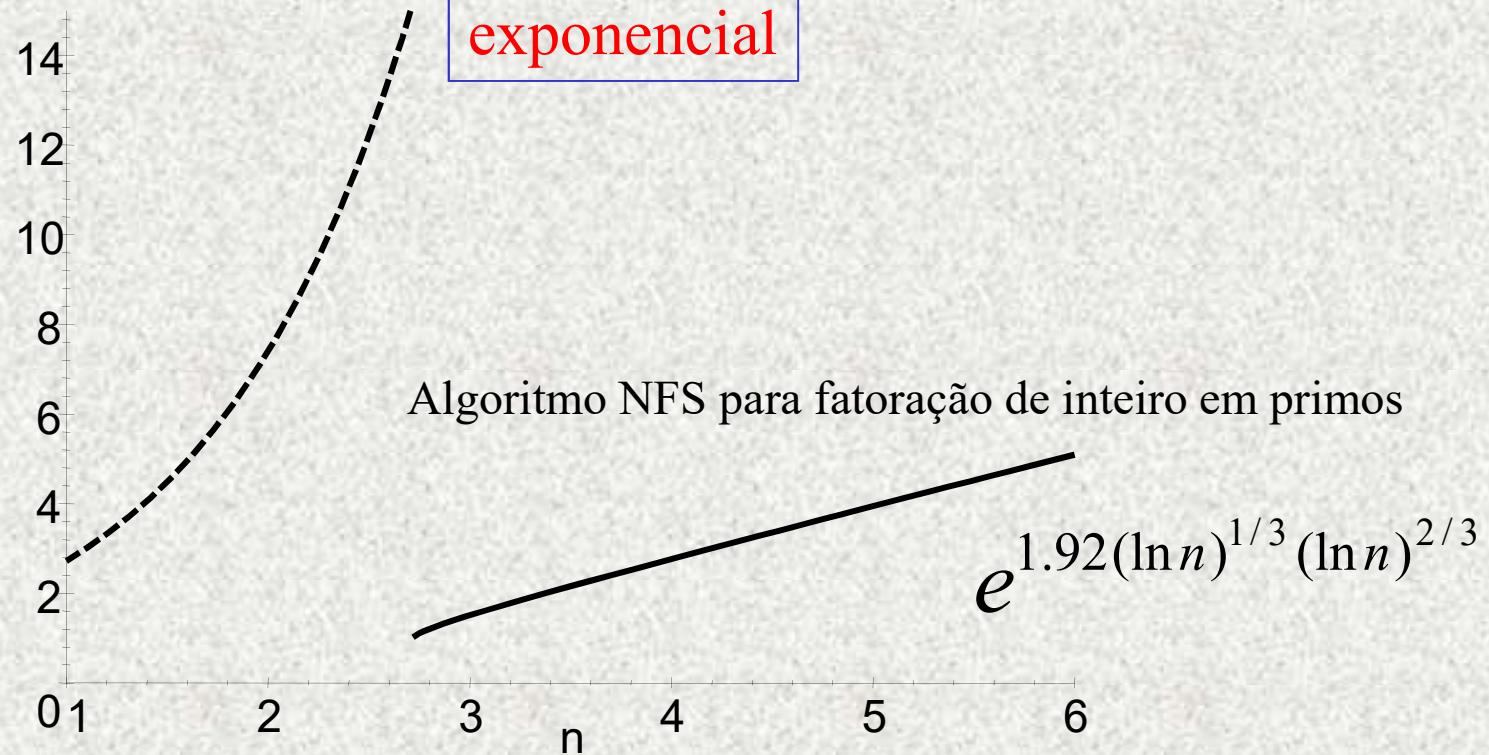

# Certificado

# Quebra do Algoritmo RSA

Dificuldade de fatoração de  $n=q.r$

RSA

Chave RSA 428 bits -- 5 mil MIPS-anos

Atualmente: recomenda-se mínimo de 768 bits em  $n$

## AES versus RSA

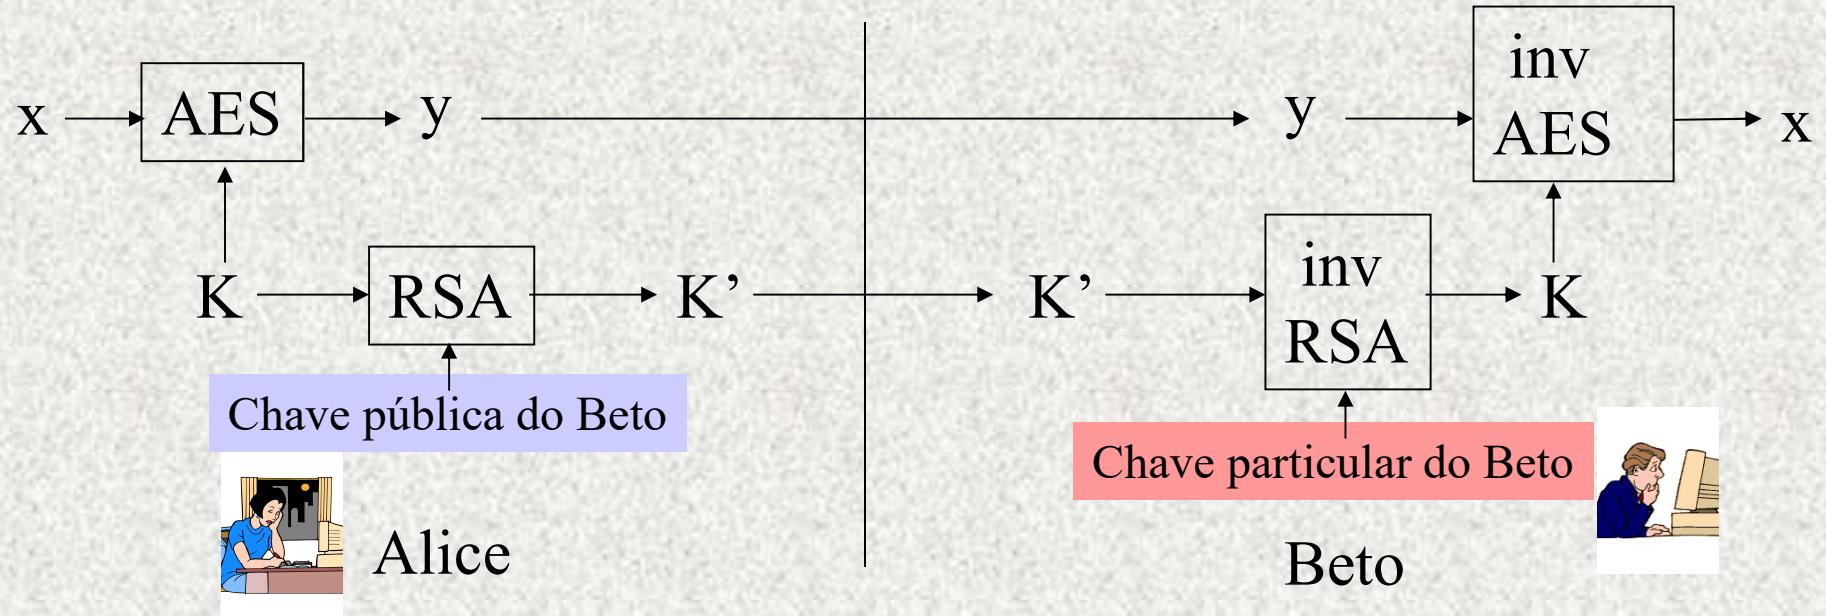

1. AES não permite assinatura criptográfica
2. RSA é cerca de 70 vezes mais lento

Em geral:

1. Cripto de chave secreta não permite assinatura criptográfica
2. Cripto de chave pública é dezenas de vezes mais lento

Recomenda-se sistema híbrido como PGP (a seguir)  
GPG → Open Source do Gnu equivalente a PGP

## Sistema híbrido

1. Chave  $K$  é gerada p/ Alice
2.  $x$  é criptografado por IDEA, com  $K$ , e  $y$  é enviado
3.  $K$  é criptografado por RSA com chave pública do Beto (retirado do certificado do Beto) e  $K'$  é enviado também
4. Beto decriptografa  $K'$  com sua chave particular
5. Com  $K$ , Beto decriptografa  $y$  por IDEA

## Philip Zimmermann

### Creator of PGP

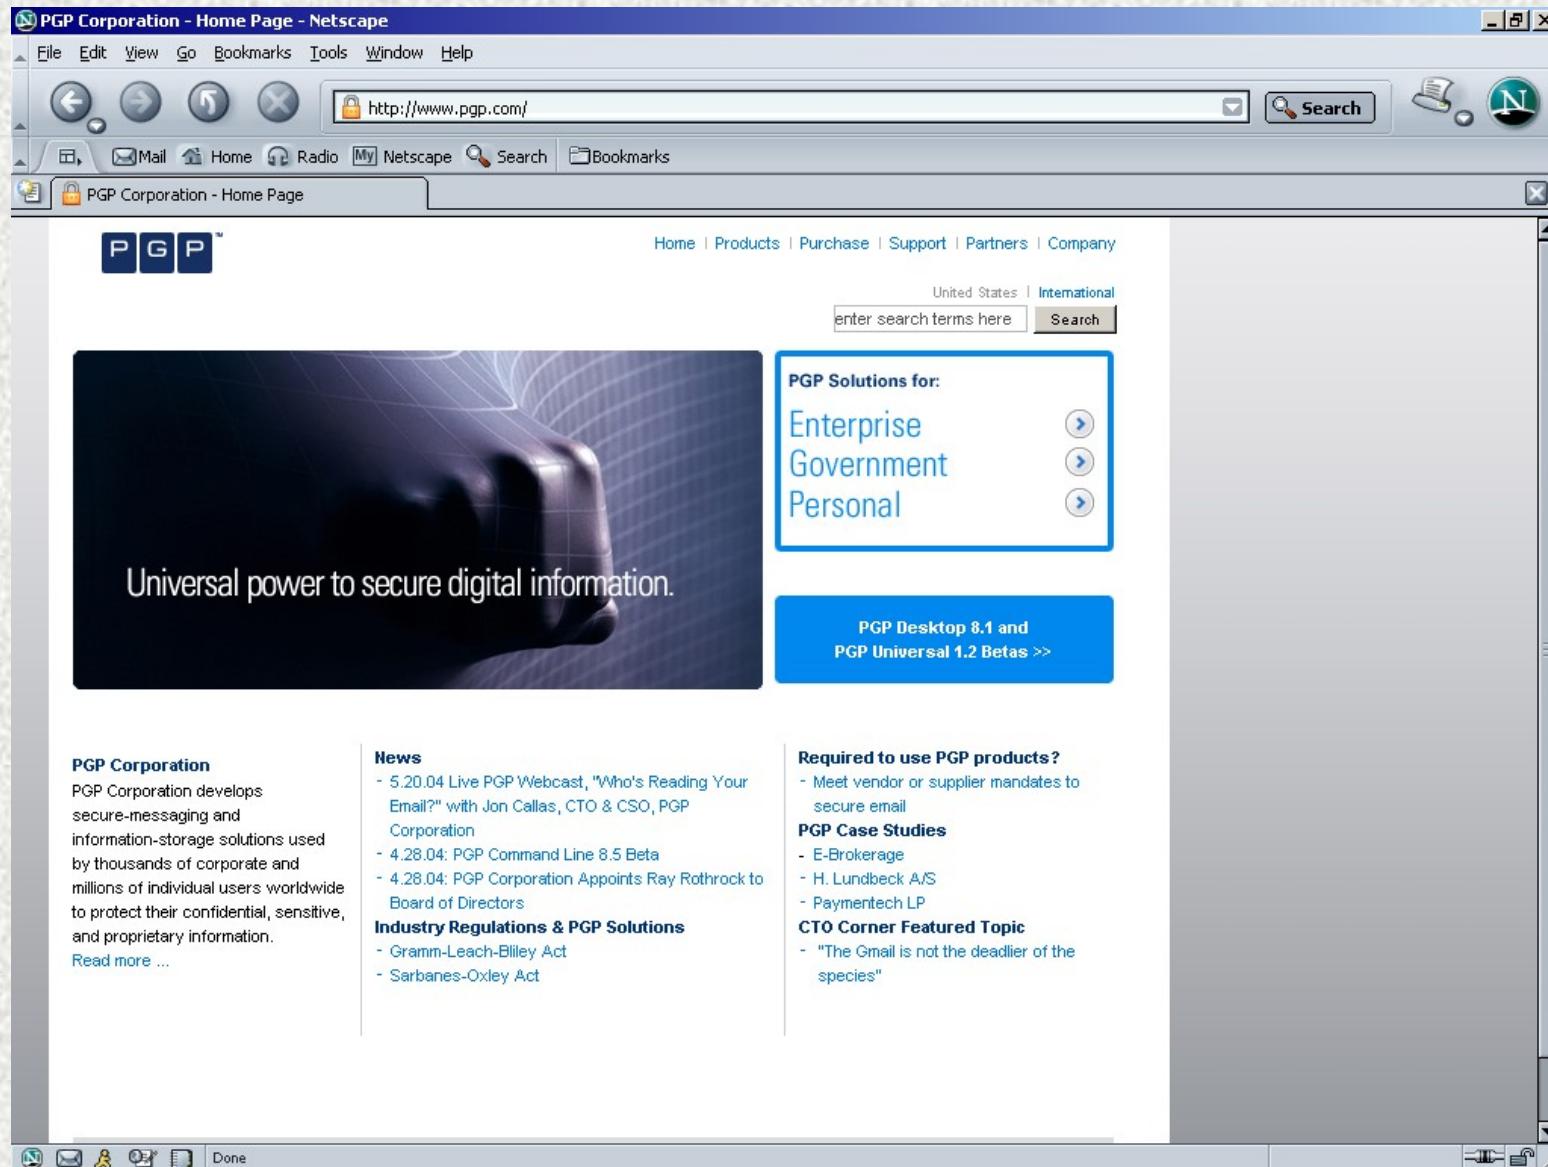

#### Background

Philip R. Zimmermann is the creator of Pretty Good Privacy. For that, he was the target of a three-year criminal investigation, because the government held that US export restrictions for cryptographic software were violated when PGP spread all around the world following its 1991 publication as freeware. Despite the lack of funding, the lack of any paid staff, the lack of a company to stand behind it, and despite government persecution, PGP nonetheless became the most widely used email encryption software in the world. After the government dropped its case in early 1996, Zimmermann founded PGP Inc. That company was acquired by Network Associates Inc (NAI) in December 1997, where he stayed on for three years as Senior Fellow. In August 2002 PGP was acquired from NAI by a new company called [PGP Corporation](#), where Zimmermann now serves as special advisor and consultant. Zimmermann currently is [consulting](#) for a number of companies and industry organizations on matters cryptographic, and is also a Fellow at the [Stanford Law School's Center for Internet and Society](#).

Before founding PGP Inc, Zimmermann was a software engineer with more than 20 years of experience, specializing in cryptography and data security, data communications, and real-time embedded systems. His interest in the political side of cryptography grew out of his [background in military policy](#) issues.

He has received numerous technical and humanitarian awards for his pioneering work in cryptography. In 2001 Zimmermann was inducted into the [CRN Industry Hall of Fame](#). In 2000 InfoWorld named him one of the [Top 10 Innovators](#) in E-business. In 1999 he received the Louis Brandeis Award from Privacy International, in 1998 a Lifetime Achievement Award from Secure Computing Magazine, and in 1996 the Norbert Wiener Award from Computer Professionals for Social Responsibility for promoting the responsible use of technology. He also received the 1995 [Chrysler Award for Innovation in Design](#), the 1995 Pioneer Award from the Electronic Frontier Foundation, the 1996 PC Week IT Excellence Award, and the 1996 Network Computing Well-Connected Award for "Best Security Product." PGP was selected by Information Week as one of the Top 10 Most Important Products of 1994. Newsweek also named Zimmermann one of the "Net 50", the 50 most influential people on the Internet in 1995.

In addition to the awards for versions of PGP developed before Zimmermann started a company, subsequent

PGP Corporation - PGP History

PGP Corporation announces partners in Europe, the Middle East, and Africa.

PGP Corporation and Network Associates announce the sale of PGP assets.

Newly formed PGP Corporation buys back PGP products and intellectual property from Network Associates.

**2001**

- ◆ PGP 7.1.1 released.
- ◆ PGP 7.1 released, including a Corporate Desktop Suite (PGP Mail, PGP Disk, PGP VPN, and PGP Firewall).

**2000**

- ◆ PGP 7.0.3 released for Individual and Freeware users; PGP 7.0.4 released for Enterprise users.
- ◆ PGP 7.0 released based on new MS Windows code. Major version includes PGP Firewall, ICQ Instant Messenger plug-in, Windows 2000 support, Notes mail plug-in, and PGP Admin for large deployments.

**1999**

- ◆ PGP 6.5 released with Virtual Private Network (VPN) and full X.509 support.

**1998**

- ◆ PGP 6.0 released with PGP Disk for Windows and a mail plug-in for Microsoft Outlook.

**1997**

- ◆ Network Associates acquires PGP Inc. for cash and warrants.
- ◆ PGP 5.5 released for both Business and Personal with PGP Admin.
- ◆ PGP 5.0 released; first complete product code rewrite since version 1.0.

**1996**

- ◆ PGP 4.5 released with simple user interface and a mail plug-in for Eudora.
- ◆ PGP Inc. formed in merger with Viacrypt.
- ◆ Legal case against Phil Zimmermann dropped by U.S. courts.

**1995**

- ◆ PGP Disk for the Macintosh released.

**1994**

- ◆ Viacrypt releases PGP 2.7.1.
- ◆ Viacrypt obtains the right to sell PGP for commercial use.

**1993**

- ◆ U.S. government files export violation case against Phil Zimmermann.

**1991**

- ◆ Phil Zimmermann releases version 1.0 of Pretty Good Privacy (PGP®).

PGP Corporation - PGP History

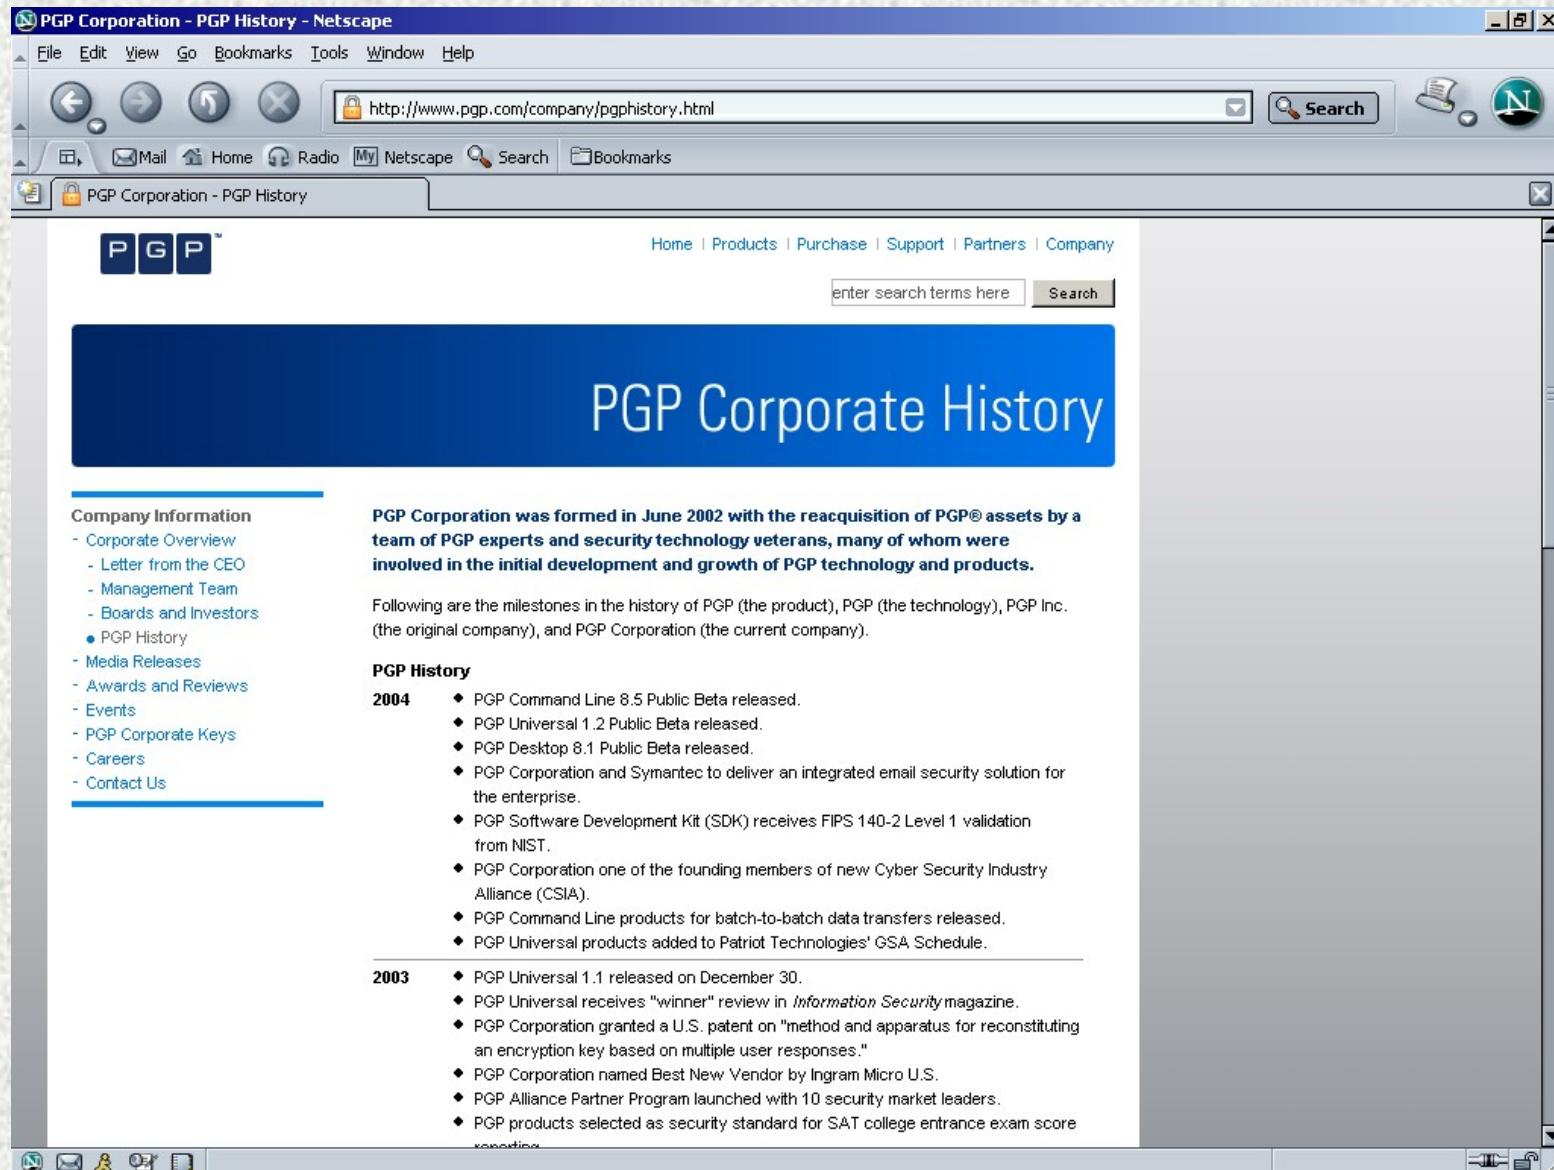

2003

- ◆ PGP Universal 1.1 released on December 30.
- ◆ PGP Universal receives "winner" review in *Information Security* magazine.
- ◆ PGP Corporation granted a U.S. patent on "method and apparatus for reconstituting an encryption key based on multiple user responses."
- ◆ PGP Corporation named Best New Vendor by Ingram Micro U.S.
- ◆ PGP Alliance Partner Program launched with 10 security market leaders.
- ◆ PGP products selected as security standard for SAT college entrance exam score reporting.
- ◆ PGP Universal 1.1 Public Beta released.
- ◆ PGP Universal receives Editors' Choice Award from *VARBusiness* magazine; PGP Corporation named a Top Technology Innovator.
- ◆ PGP Desktop 8.0.3 released for Macintosh and Windows.
- ◆ PGP Corporation announces Business Advisory Board.
- ◆ PGP Corporation announces and ships PGP Universal, a new self-managing security architecture and product line.
- ◆ PGP Corporation signs distribution agreement with Ingram Micro, the largest global wholesale provider of technology products and supply chain management services.
- ◆ PGP Corporation named to AlwaysOn List of Top 100 Private Companies.
- ◆ PGP Enterprise 8.0 receives Reader Trust Award for Best Encryption, SC Awards Council's Best Encryption Solution (Highly Commended), and SC Awards Council's Best Email Security (Highly Commended) from *SC Magazine*.
- ◆ PGP Corporation announces new partners in Chile, India, Japan, and Korea.
- ◆ PGP Personal 8.0 receives Editor's Choice review by *Macworld* magazine.
- ◆ PGP Personal 8.0 named Best Encryption Software and one of CNET's Top 100 Products.
- ◆ PGP 8.0.2 released for Macintosh and Windows.
- ◆ PGP 8.0.1DE for Windows released for German-language users.

---

2002

- ◆ PGP Corporation releases source code for peer review.
- ◆ PGP Personal and PGP Freeware released.
- ◆ PGP 8.0 released for Macintosh and Windows.
- ◆ PGP Corporation announces partners in Latin America, Southeast Asia, and Australia.
- ◆ PGP Corporation assumes worldwide technical support responsibilities.
- ◆ PGP Corporation announces U.S. and Canada partner reseller program.
- ◆ PGP Corporation moves into new corporate facilities in Palo Alto, California.
- ◆ PGP 7.2 for Mac OS 9 released.
- ◆ PGP Corporation announces partners in Europe, the Middle East, and Africa.

  - Main Content:**

**PGP Corporation was formed in June 2002 with the reacquisition of PGP® assets by a team of PGP experts and security technology veterans, many of whom were involved in the initial development and growth of PGP technology and products.**

Following are the milestones in the history of PGP (the product), PGP (the technology), PGP Inc. (the original company), and PGP Corporation (the current company).

**PGP History**

**2004**

    - PGP Command Line 8.5 Public Beta released.
    - PGP Universal 1.2 Public Beta released.
    - PGP Desktop 8.1 Public Beta released.
    - PGP Corporation and Symantec to deliver an integrated email security solution for the enterprise.
    - PGP Software Development Kit (SDK) receives FIPS 140-2 Level 1 validation from NIST.
    - PGP Corporation one of the founding members of new Cyber Security Industry Alliance (CSIA).
    - PGP Command Line products for batch-to-batch data transfers released.
    - PGP Universal products added to Patriot Technologies' GSA Schedule.

**2003**

    - PGP Universal 1.1 released on December 30.
    - PGP Universal receives "winner" review in *Information Security* magazine.
    - PGP Corporation granted a U.S. patent on "method and apparatus for reconstituting an encryption key based on multiple user responses."
    - PGP Corporation named Best New Vendor by Ingram Micro U.S.
    - PGP Alliance Partner Program launched with 10 security market leaders.
    - PGP products selected as security standard for SAT college entrance exam score encryption.

PGP Desktop 8.1 Beta

PGP Desktop Feature Comparison

Why PGP Products?

**PGP Personal Desktop enables individuals to protect confidential communications and digitally stored information with an integrated solution based on strong, broadly adopted security technology.**

**PGP® Personal Desktop**

PGP Personal Desktop includes the same core PGP Mail and PGP Disk capabilities as the PGP Desktop products:

- ◆ **PGP Mail**—Encrypts email, files, and instant messages and also provides the ability to manage PGP keys.
- ◆ **PGP Disk**—Transparently creates volumes whose contents are encrypted when not in use. (Note that this component is not equivalent to PGP Corporate Disk, an information-storage security solution that combines desktop disk security, IT configuration and deployment tools, and advanced key and Additional Decryption Key [ADK] features for users of PGP Universal.)

Find out more

Available for both Macintosh and Windows operating systems.

PGP Mobile

**PGP Mail Supports**

- ◆ Microsoft Outlook 98, 2000, XP, and 2003
- ◆ Microsoft Outlook Express 4.x, 5.x, and 6.x
- ◆ Eudora 5.0 or later for Windows
- ◆ ICQ 99b-2003a Instant Messenger
- ◆ Microsoft Entourage for Mac OS X
- ◆ Apple Mail.app

**Public Key Formats**

- ◆ OpenPGP RFC 2440
- ◆ X.509

**Symmetric Key Algorithms**

- ◆ AES with up to 256-bit keys
- ◆ CAST
- ◆ TripleDES
- ◆ IDEA
- ◆ Twofish

**Hashes**

- ◆ SHA-1
- ◆ MD5
- ◆ RIPEMD-160

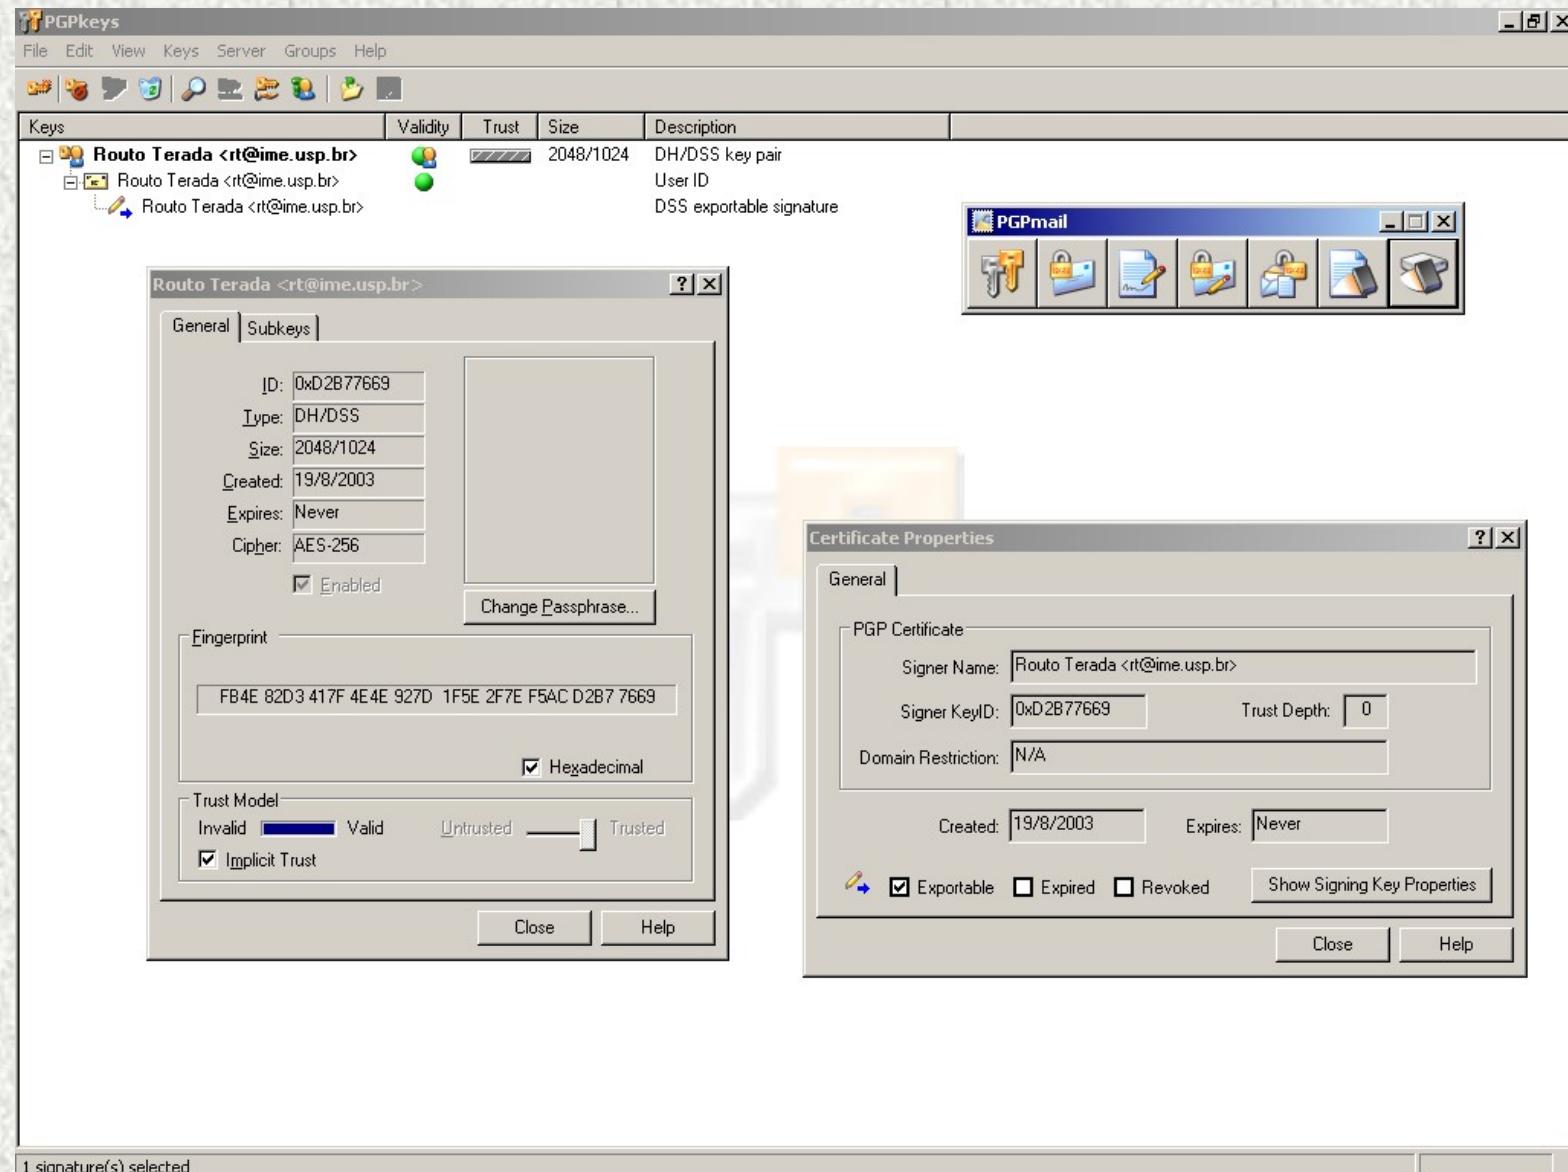

**Public Key Algorithms**

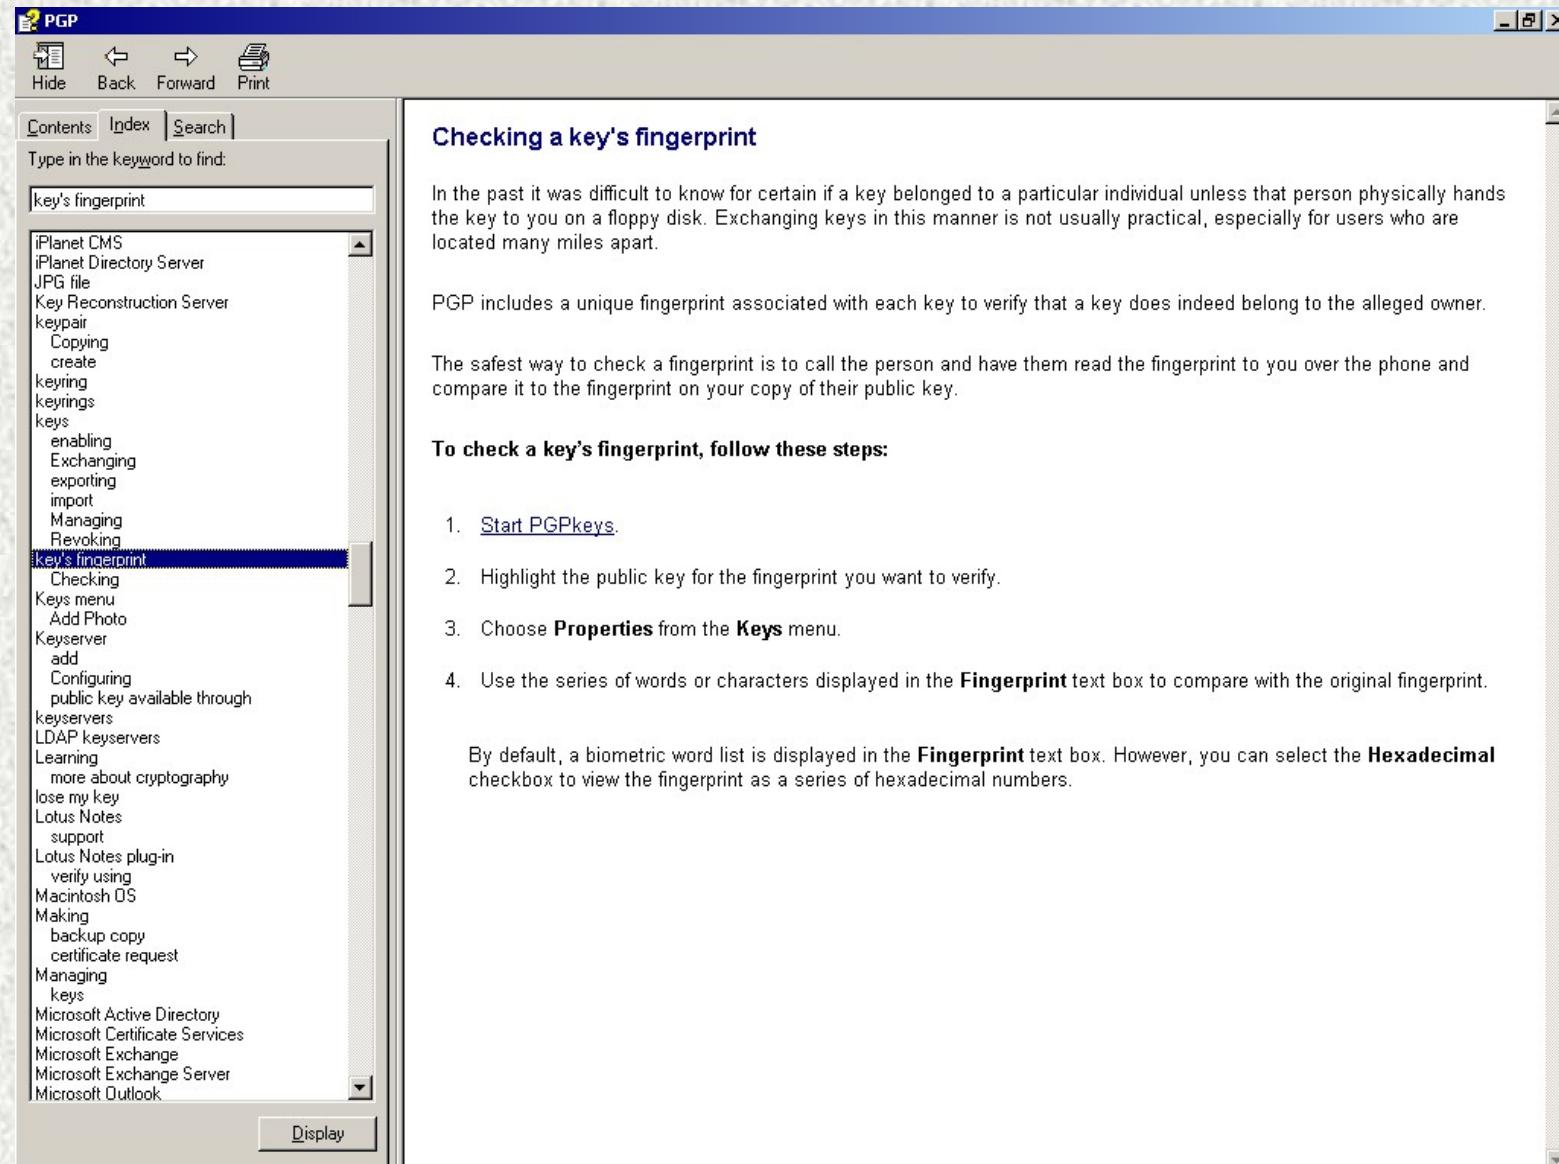

- ◆ Diffie-Hellman
- ◆ DSS
- ◆ RSA with up to 4096-bit keys

Done

The screenshot shows a Windows-style application window for PGP documentation. The title bar says 'PGP'. The menu bar includes 'File', 'Hide', 'Back', 'Forward', and 'Print'. The left sidebar has 'Contents', 'Index', and 'Search' buttons, and a search input field with 'keys, exporting' typed in. A scrollable list of topics is shown, with 'exporting' highlighted. The main content area has a title 'About importing and exporting keys' and a sub-section 'Here are some ways to export or distribute your key:' followed by a list of four methods. Below this is another sub-section 'Here are some ways to import or receive other user's keys:' with a list of three methods. The bottom of the sidebar has a 'Display' button.

**About importing and exporting keys**

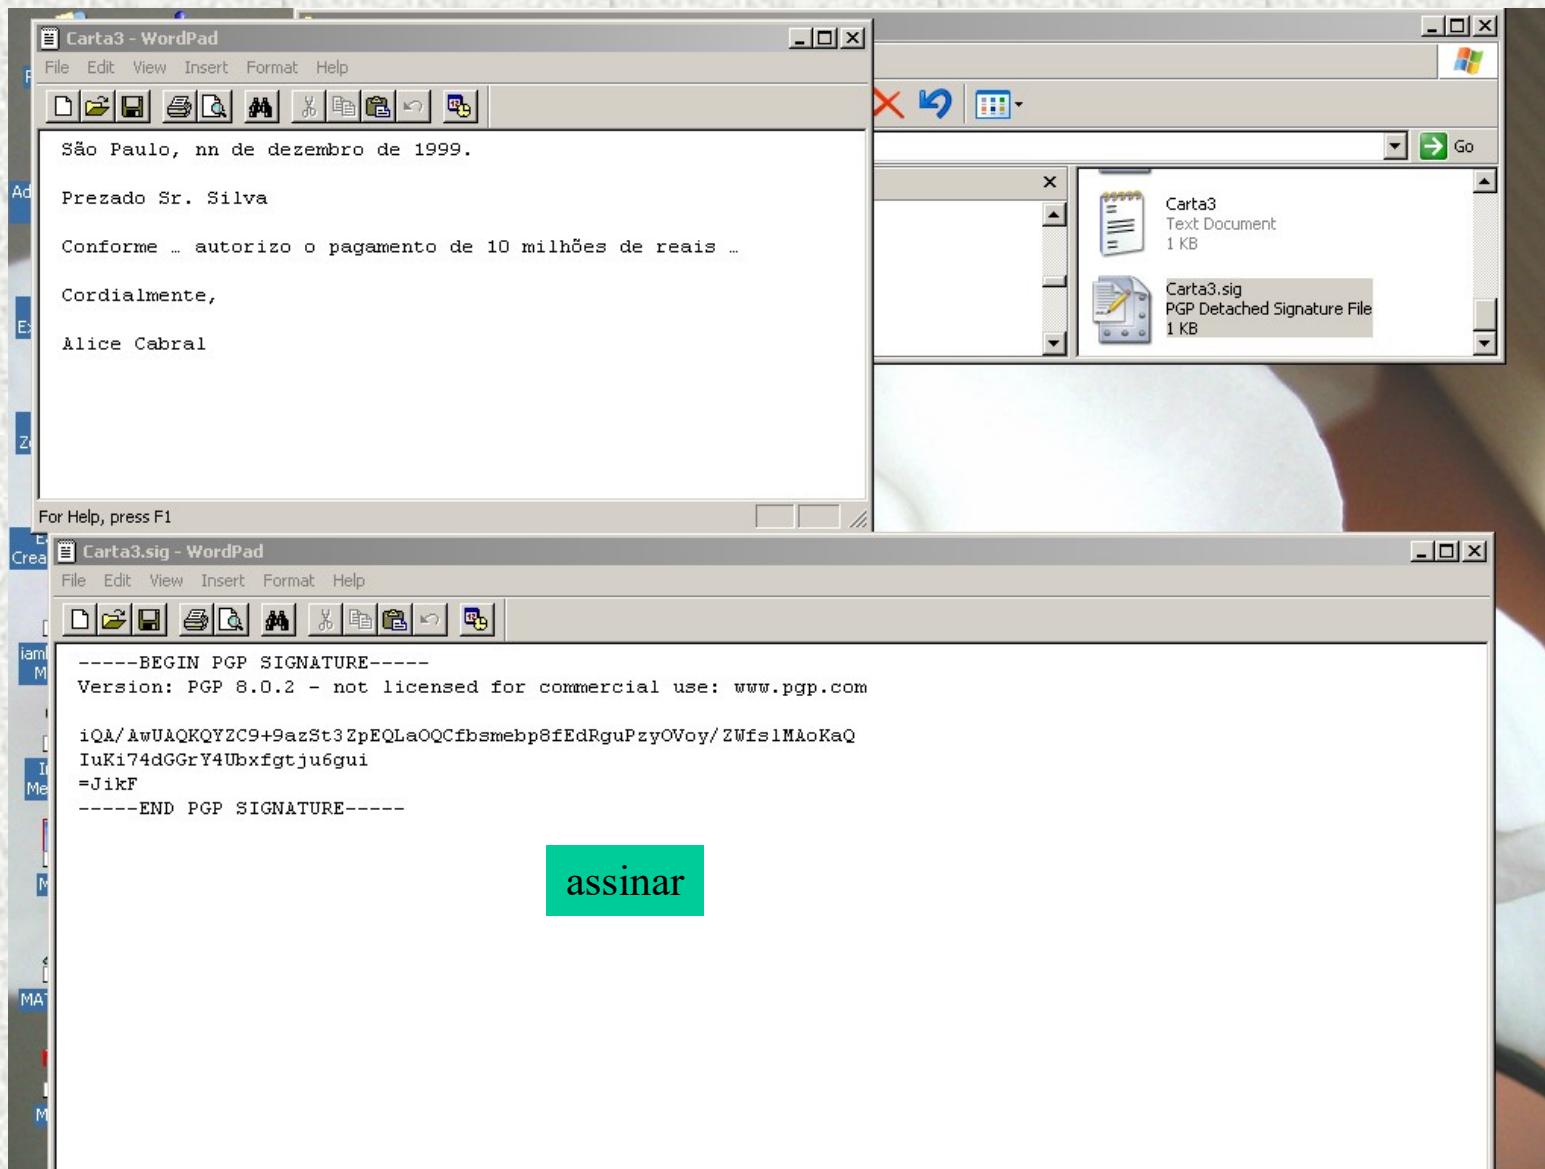

Here are some ways to export or distribute your key:

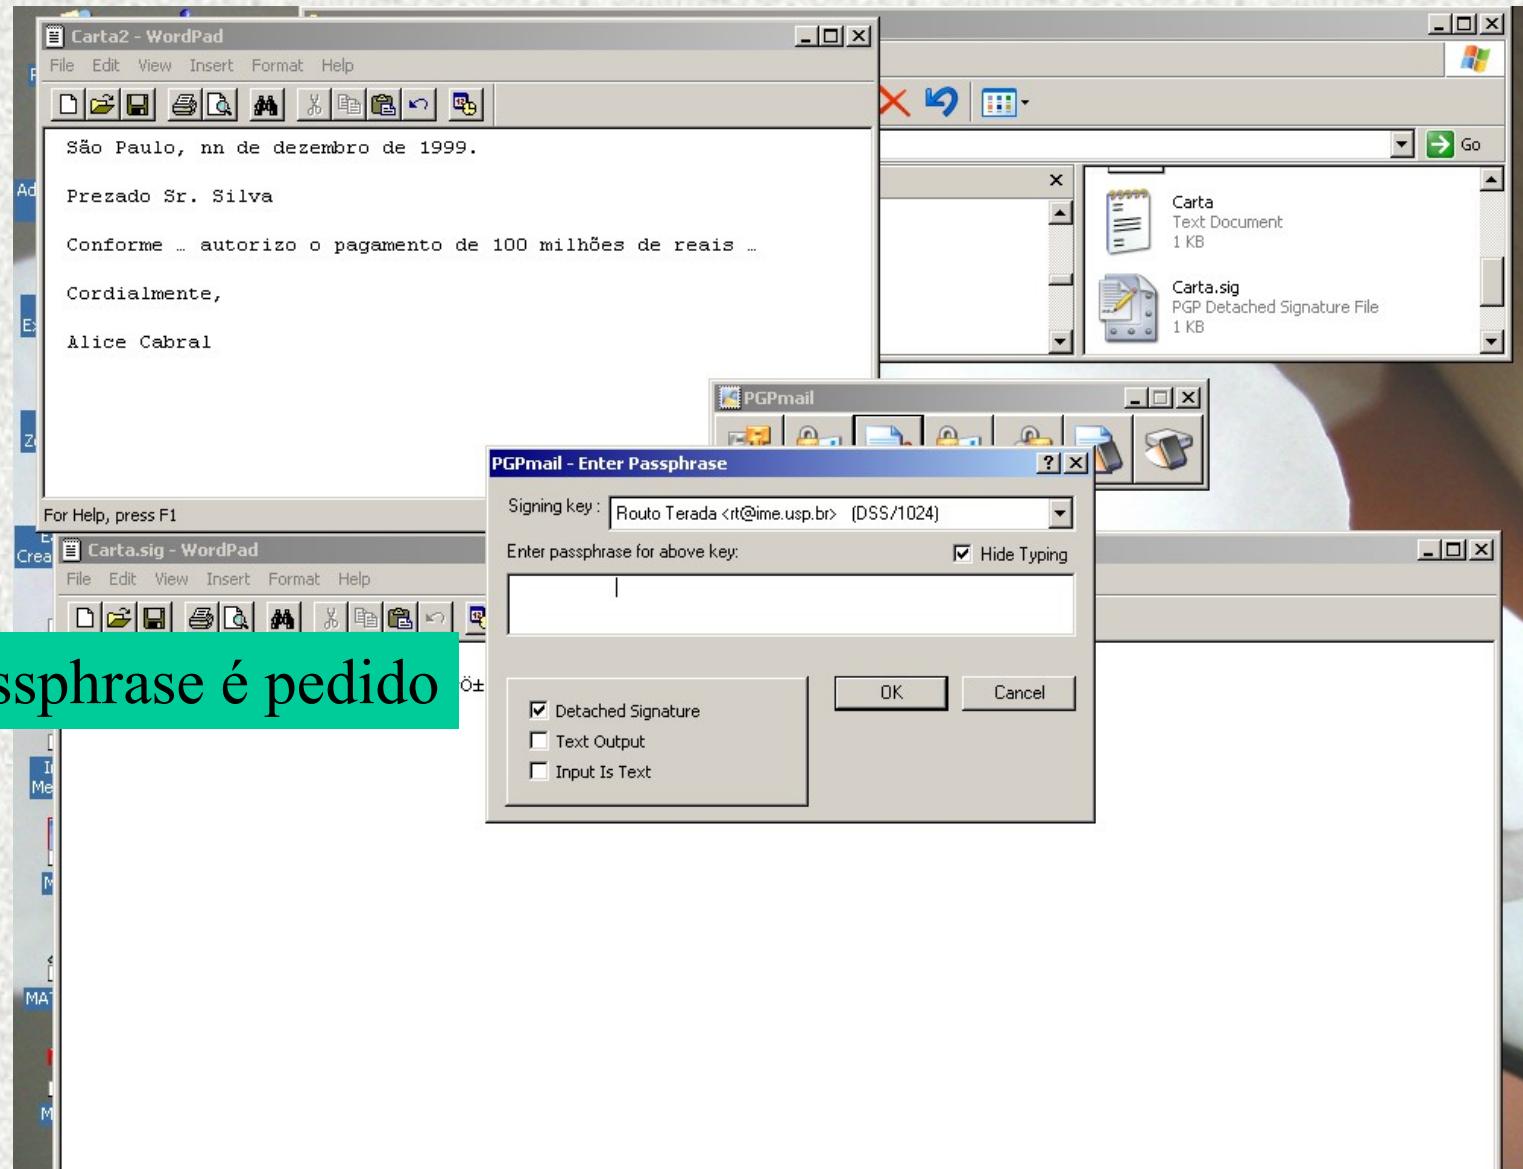

- [Make your public key available through a public certificate server.](#)
- [Include your public key in an email message.](#)
- [Export your public key or copy it to a text file.](#)
- [Copy your key from a smart card directly to someone's keyring](#)

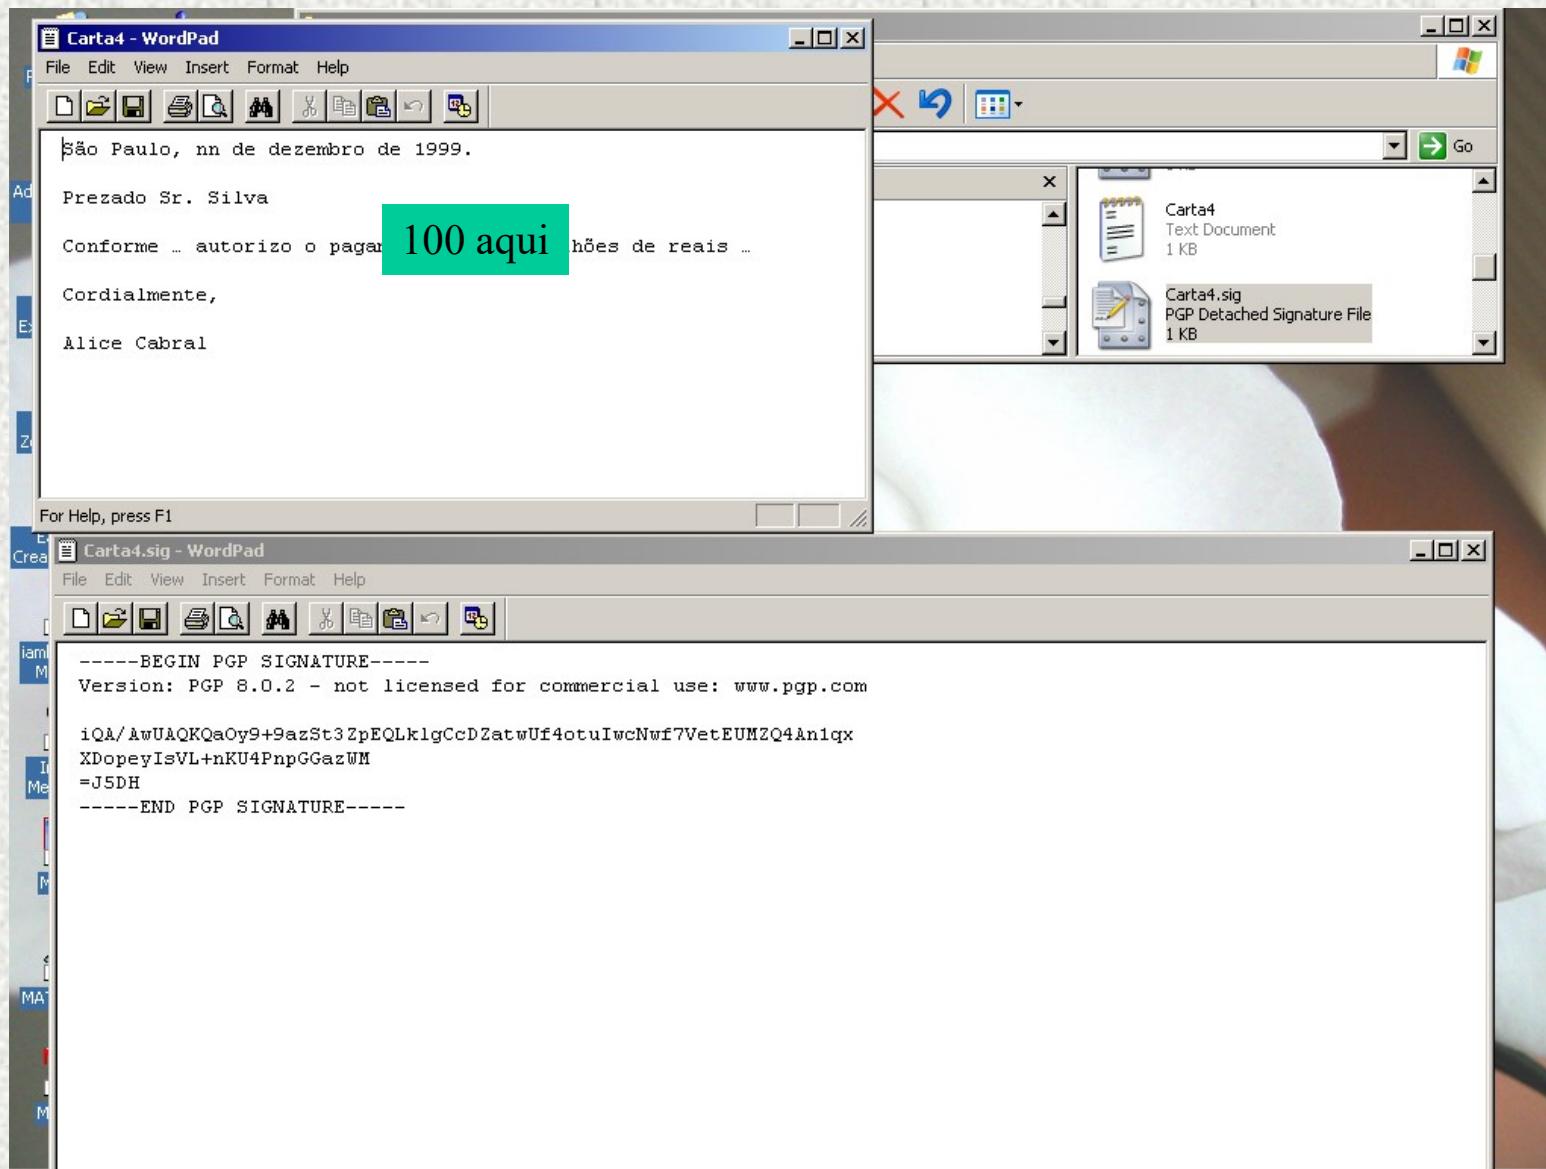

Your public key is basically composed of a block of text, so it is quite easy to make it available through a public certificate server, include it in an email message, or export or copy it to a file. The recipient can then use whatever method is most convenient to add your public key to their public keyring.

Here are some ways to import or receive other user's keys:

- [Get the key from a public certificate server.](#)
- [Add the public key to your keyring directly from an email message.](#)
- [Import the public key from a shared file.](#)

São Paulo, nn de dezembro de 1999.

Prezado Sr. Silva

Conforme ... autorizo o pagamento de 10 milhões de reais ...
